

**OFFICIAL RESPONSE TO SIGNIFICANT ENVIRONMENTAL
POINTS RAISED DURING THE TIMBER HARVESTING PLAN
EVALUATION PROCESS**

**FROM THE DIRECTOR OF THE CALIFORNIA DEPARTMENT OF
FORESTRY AND FIRE PROTECTION (CAL FIRE)**

TIMBER HARVESTING PLAN (THP)No:	1-21-00096-MEN
SUBMITTER:	Mendocino Redwood Company LLC
COUNTY:	Mendocino
END OF PUBLIC COMMENT PERIOD:	February 17, 2022
DATE OF RESPONSE AND APPROVAL:	April 1, 2022

The California Department of Forestry and Fire Protection (CAL FIRE) serves as the lead agency in the review of Timber Harvesting Plans. These plans are submitted to CAL FIRE, which directs a multidisciplinary review team of specialists from other governmental agencies to ensure compliance with environmental laws and regulations. As a part of this review process, CAL FIRE accepted and responded to comments, which addressed significant environmental points raised during the evaluation of the plan referenced above. This document is the Director's official response to those significant environmental points, which specifically address this Timber Harvesting Plan. Comments, which were made on like topics, have been grouped together and addressed in a single response. Remarks concerning the validity of the review process for timber operations, questions of law, or topics and concerns so remote or speculative that they could not be reasonably assessed or related to the outcome of a timber harvesting operation, have not been addressed.

Sincerely,

James Strong
Forester II, Forest Practice
RPF #2689

cc: RPF, Unit, File; Timber Owner, Timberland Owner and/or Submitter
CP, CDFW, DPR, & RWB

through <https://caltreesplans.resources.ca.gov/caltrees/caltrees.aspx>

PUBLIC NOTIFICATION

To inform the public of this proposed Timber Harvesting Plan (THP) and determine if there were any concerns with the plan the following actions were taken:

- Notification of the receipt of a timber harvesting plan was sent to the adjacent landowner(s).
- Notice of the receipt of the plan was submitted to the county clerk for posting with other environmental notices.
- Notice of the plan was posted at the Department's local office and also at the regional office in Santa Rosa.
- Notice of the receipt of the THP was sent to those organizations and individuals on the Department's list for notification of plans in the county.
- A "Notice of the Intent to Harvest Timber" was posted near the plan site.

THP REVIEW PROCESS

The laws and regulations that govern the Timber Harvesting Plan review process are found in Statute law in the form of the Forest Practice Act which is contained in the Public Resources Code (PRC) and Administrative law in the rules of the Board of Forestry and Fire Protection (the Forest Practice Rules) which are contained in the California Code of Regulations (CCR).

The Forest Practice Rules are lengthy in scope and detail and provide explicit instructions for permissible and prohibited actions that govern the conduct of timber operations in the field. The major categories covered by the rules include:

- Timber Harvesting Plan contents and the Timber Harvesting Plan review process
- Silvicultural methods
- Harvesting practices and erosion control
- Site preparation
- Watercourse and lake protection
- Hazard reduction
- Fire protection
- Forest insect and disease protection practices
- Coastal Commission Special Treatment Areas
- Use, construction and maintenance of logging roads and landings
- County-specific rules

When a THP is submitted to the Department, it undergoes a multidisciplinary review consisting of several steps. In addition to CAL FIRE, the Review Team members include representatives of the California Department of Fish and Wildlife (CDFW); the appropriate Regional Water Quality Control Board (RWQCB or RWB); California Geological Survey (CGS); the Department of Parks and Recreation (DPR); the appropriate County Planning office; and if within their jurisdiction, the Coastal Commission (CC) (14 CCR §1037.5(a)). Once submitted the Director determines if the plan is accurate, complete, and in proper order, and if so, files the plan (14CCR §1037). In addition, the Review Team determines whether a Pre Harvest Inspection (PHI) is necessary, and what areas of concern are to be examined during the inspection (14 CCR §1037.5(g)(1)).

April 1, 2022

If the plan is accepted for filing, and a PHI is determined to be needed, a field review is conducted to evaluate the adequacy of the THP. All agency personnel who comprise the multidisciplinary Review Team are invited to attend the PHI as well as other experts and agency personnel whom the Department may request. During this field review, additional mitigation and/or recommendations may be formulated to provide greater environmental protection. These recommendations are forwarded to the RPF along with the Review Team member's PHI Report. The RPF will respond to the recommendations made and forward these to the Region office and Second Review Team Chair.

A Second Review Team meeting is held where members of the multidisciplinary Review Team meet to review all the information in the plan, and develop a recommendation for the Director (14 CCR §1037.5(g)(2)). Prior to and/or during this meeting they examine all field inspection reports, consider comments raised by the public, and discuss any additional recommendations or changes needed relative to the proposed THP. These recommendations are forwarded to the RPF. If there are additional recommendations, the RPF will respond to each recommendation, and forward their responses to the regional office in Santa Rosa.

The representative of the Director of the Department reviews all documents associated with the proposed THP, including all mitigation measures and plan provisions, written correspondence from the public and other reviewing agencies, recommendations of the multidisciplinary Review Team, and the RPF's responses to questions and recommendations made during the review period. Following consideration of this material, a decision is made to approve or deny a THP.

If a THP is approved, logging may commence. The THP is valid for up to five years, and may be extended under special circumstances for a maximum of two more years, for a total of seven years.

Prior to commencing logging operations, the Registered Professional Forester must meet with the licensed timber operator (LTO) to discuss the THP (CCR §1035.2); a CAL FIRE representative may attend this meeting. The Department makes periodic field inspections to check for THP and rule compliance. The number of inspections depends upon the plan size, duration, complexity, and the potential for adverse impacts. Inspections include but are not limited to inspections during operations pursuant to Public Resources Code (PRC) section 4604, inspections of completed work pursuant to PRC section 4586, erosion control monitoring as per PRC section 4585(a), and stocking inspection as per PRC section 4588.

The contents of the THP, the Forest Practice Act, and rules, provide the criteria which CAL FIRE inspectors use to determine compliance. While the Department cannot guarantee that there will be no violations, it is the Department's policy to vigorously pursue the prompt and positive enforcement of the Forest Practice Act, the Forest Practice Rules, related laws and regulations, and environmental protection measures that apply to timber operations on non-federal land in California. This enforcement is directed primarily at preventing forest practice violations, and secondarily at prompt and adequate correction of violations when they occur.

The general means of enforcement of the Forest Practice Act, the rules, and other related regulations range from the use of violation notices, which require corrective action, to criminal proceedings through the court system. Timber operator and Registered Professional Forester licensing action may also be pursued. Most forest practice violations are correctable and the

April 1, 2022

Department's enforcement program assures correction. Where non-correctable violations occur, criminal action is usually taken. Depending on the outcome of the case and the court in which the case is heard, some sort of environmental corrective work is usually done. This is intended to offset non-correctable adverse impacts.

Once harvesting operations are finished, a completion report must be submitted certifying that the area meets the requirements of the rules. CAL FIRE inspects the area to verify that all aspects of the applicable rules and regulations have been followed, including erosion control work. Depending on the silvicultural system used, the stocking standards of the rules must be met immediately or in certain cases within five years. A stocking report must be filed to certify that the requirements have been met.

BACKGROUND

Timber Harvesting Plan (THP) # 1-21-00096-MEN "Snuffins Creek" proposes to harvest timber on 457 acres of Mendocino Redwood Company LLC (MRC) timberland using the Group Selection, Selection, and Variable Retention silvicultural methods. The THP was received by CAL FIRE on June 18, 2021, accepted for filing on July 29, 2021, and a Preharvest Inspection (PHI) was conducted on December 9, 2021. Attendees on this PHI included: .

- Kevin Doherty (CGS)
- Mitchel Bosma, Jeff Longcrier (CAL FIRE Inspector)
- Christopher Kirk (RPF)
- Justin Fitt (NCRWQCB)

April 1, 2022

The Final Interagency Review (aka Second Review) occurred on January 27, 2022 which generated nine recommendations. The RPF responded to these recommendations on February 4, 2022. Another Second Review meeting occurred on February 7, 2022. The Second Review Chair recommended the plan be approved. The public comment period then ended on February 17, 2022.

The initial deadline for the Director's Determination Deadline (DDD) was set for March 4, 2022 per 14 CCR § 1037.4. Multiple extensions were granted extending the DDD to April 1, 2022 in order to address public comments, generate the Official Response (OR) to concerns brought up by the public, and evaluate the Plan for final approval.

PUBLIC COMMENT SUMMARY

During the public comment period for this THP as described above, there was 1 public comment letter received at the CAL FIRE Region Headquarters in Santa Rosa. This public comment brought up concerns that are addressed in this Official Response (OR). General concerns are grouped by subject matter and followed by the Department's response. Original text taken directly from the public comment, rules, reports, or the THP are presented as italicized text. Words that are emphasized in responses have underlined font. The public comments are identified with the CAL FIRE "PC" code. A copy of the original letters sent to the Department are viewable through the Department's online Forest Practice Database CalTREES.

CalTREES instructions: navigate to <https://caltreesplans.resources.ca.gov/caltrees/caltrees.aspx> Click the search icon at the top of the page, then type the Plan # in the Record Number box (county identifier not needed). Under the Document Number column, select the Plan Number for the "Timber Harvest Plan" Type. Below the "Record Details" should be a list of attachments for the Plan. (Note: if there are a substantial number attachments, or attachments with large file sizes, it may take some time to load). The Public Comments are labeled under "Record Type" and are in pdf format, usually with a "PC" label.

SUMMARY OF SIGNIFICANT ENVIRONMENTAL GENERAL CONCERNS WITH RESPONSES

1. CONCERN: Sediment and Temperature TMDL Impacts to Big River Watershed

The letter expressed concern that timber operations would lead to significant temperature and sediment impacts.

RESPONSE: The THP drains to the Big River, which is a 303(d) listed for sediment and temperature. The Plan proposes 71.5 acres of Group Selection, 176.5 acres of Selection, and 206.5 acres of Variable Retention utilizing tractor and cable yarding. Tractor yarding is limited to gentler slopes. The plan outlines on pages 131-132, a partial list of measures to reduce, mitigate or avoid sediment production. Sediment impacts could occur due to sediment transport from roads into watercourses, activation of slides, and disturbance of soils near watercourses. The Plan seeks to minimize the potential for these issues by:

- Comply with the Anadromous Salmonid Protection (ASP) rules which provide WLPZ buffers on all Class I and Class II watercourses and equipment limitation zones on Class III watercourses.
- Soil disturbance on steep slopes is minimized by using modern cable yarding harvest systems.
- Existing and potential sediment production sites have been identified and corrective action proposed, as detailed in the Erosion Control Plan (ECP).
- A professional geologic evaluation has provided mitigation measures for operations near unstable areas.

The THP includes an Erosion Control Plan (ECP) in THP Section V, pages 261-266. The ECP documents an inventory, prioritization, and proposed treatment of potential Controllable Sediment Discharge Sources (CSDS) in the plan area. This plan has 18 CSDS's, and one Non-Controllable Sediment Discharge Source (ECP-1), which were reviewed by the review team agencies, including CAL FIRE, NCRWQCB, CGS, and CDFW during the PHI. The identification and inventory of these sources shows how the current road system will be upgraded for long-term decrease in erosion to the watershed.

The THP addresses roads under item 24 of Section II of the THP (starting page 23). The Plan proposes to build 7,352 feet of new seasonal road. The FPRs require that all roads be maintained during the life of the THP as well as 3 years after completion of operations.

The CGS had recommendations surrounding road points, and unstable features that were all addressed. A Geology Report was written, pages 266.1-266.42, of the THP, as a result of a CGS PHI recommendation. This geology report was completed by a professional geologist (PG) for in order to verify that all the unstable features had been identified, and to minimize the potential for landslide derived sediment delivery to nearby watercourses. The conclusion of the Geologic Report was that, "operations, as presently proposed, have a low probability of accelerating the contribution of landslide-derived sediment to down slope bodies of water" (page 266.14).

April 1, 2022

The Geology Report made numerous recommendations, all of which were incorporated into the THP, and many of which “recommended higher timber retention where risk of sediment delivery to resources related to landslide hazards were identified within and adjacent to the plan area. “

Sediment may also enter the watershed via the watercourse system. The RPF has mapped all watercourses within the THP area. During the PHI, the review team inspected a sample of the watercourses. The PHI team found the watercourses were appropriately identified and protection measures were consistent with the FPRs. The RPF utilized the WLPZ standards consistent with the Anadromous Salmonid Protection (ASP) rules. The 2009 ASP rules were developed to ensure rule adequacy in protecting listed anadromous salmonid species and their habitat, to further opportunities for restoring the species’ habitat, and to ensure the rules are based on credible science. The THP implements these minimum standards. According to the CAL FIRE PHI report, page 10, item 75 the CAL FIRE inspector reported the following:

If there are waterbodies within or downstream of the proposed Plan that are listed as water quality limited under Section 303(d) of the Federal Clean Water Act, has the RPF assessed for impacts that may combine with existing listed stressors to impair beneficial uses of the waterbody?

Inspectors Observations: Section I Item 7(d) in the THP shows the watershed is listed as 303(d) impaired for Sediment

Item 76 on the same page from the CAL FIRE PHI report, states the following:

Comments or general observations regarding Cumulative Impacts: I have reviewed the THP and the cumulative impacts assessment and have conducted a field inspection of the plan and assessment area. I am also familiar with the assessment area based on previous work history. The THP includes mitigation measures that address watershed resources in THP items 26&27. Measures that address soil stabilization are included in THP items 18, 21, & 23.... After review of the information available to me, I concur with the RPF that as proposed and mitigated, timber operations will not combine with other past, present or future operations to have a significant negative effect on the environment.

Lastly, page 6 of PHI report generated by NCRWQCB states the following.

If the review team recommendations, including those of the Regional Water Board, are incorporated into the THP, once approved, the THP will be likely to avoid or minimize both short term and long-term adverse impacts to beneficial uses of water. When considered with the proposed silviculture, the requirements for post-harvest retention of overstory canopy, and watercourse and lake protection zone requirements, the plan will likely comply with applicable water quality standards and therefore will be eligible for coverage under the Order. (Emphasis added)

The RPF has incorporated the Water Qualities Review Team recommendations. The proposed silviculture system also provides an additional buffer to the watercourse system because of the additional tree canopy retention and surface cover remaining post-harvest. The residual stand

April 1, 2022

intercepts rainfall and provides a more intact surface cover, especially in the cable yarding areas where exposed soil is minimized.

The THP also includes soil stabilization measures under item 18 of the THP. These measures ensure that exposed soil is treated to prevent erosion, roads and landings are maintained for proper drainage, and skids trails are treated. The completion of these activities minimizes soil erosion. Soil stabilization in combination with the WLPZ standards provides a sediment buffer to streams.

Stream temperatures are a result of a complicated ecosystem process including forestry, geology and hydrology. Shade from WLPZs moderates stream temperatures through retention of stream canopy. Excessive removal of riparian canopy could lead to excessive summer temperatures that may be lethal to aquatic invertebrates and fish. The retention of WLPZs even along clearcut units has been found to be effective in shading the streams. The amount of shade canopy and distance of WLPZs increases as the watercourse classifications change. For example, small class III watercourses that are capable of transporting sediment during the winter require less shade canopy due to their small stream size and intermittent nature. Class II watercourses, which support non-fish aquatic life, require more shade canopy and wider buffers. Class I watercourses, which support fish habitat, require the widest buffers with the highest shade canopy. The ASP rules were established based on scientific review and have established WLPZs that maintain current stream temperatures through shade canopy requirements.

The THP discloses numerous class I, II and III watercourses. These watercourses have protection measures outlined on pages 38.1 - 42 of the THP. In addition to the effects of canopy retention on stream temperature, groundwater and bank storage contributes to stream flow and is not subject to changes in temperature from canopy cover.

Given the protection measures on the THP and the field observations made on the PHI, CAL FIRE determined that sediment and temperature impacts have been mitigated and the proposed timber operations are appropriate based on the entirety of the Plan. The plan is in compliance with the FPRs and MRC's Option A in relation to watercourse protection. According to the PHI report, all watercourses have been correctly described and classified. The protection measures within the watercourses have been inspected and determined to be adequate to protect the beneficial uses of water, native aquatic and riparian species, and the beneficial functions of the riparian zone.

The THP also presents a winter period operating plan of the which the inspector states:

The period of operations during the winter period is clearly defined, excluding all operations from saturated soil conditions. Downstream beneficial uses of water will be adequately protected, provided the operator complies with all operational provisions of the winter period operating plan.

Due to these mitigations and protection measures, and considering the requirements outlined in the Forest Practice Rules it has been determined that the proposed project as presented will not cause or add to significant cumulative impacts within the assessment area, follows the FPRs, and can reasonably be assumed to adequately consider and protect downstream beneficial uses.

April 1, 2022

2. CONCERN: Sediment and Temperature TMDL Impacts to Big River Watershed cannot be evaluated without a baseline of data.

RESPONSE: The public comment makes assertions in various places that a proper sediment or temperature baseline has not been established, and that this baseline is essential for adequate CEQA review. Although the emphasis of the comment is in regard to the need for sediment baseline, there are references to the need for a temperature baseline as well. In addition to the response to Concern 1 above, this THP has provided a baseline data inventory for the entire planning watershed as well as the appurtenant road system. Pages 28-33 of the THP lists 36 road points associated with this THP and the proposed mitigation measures and an implementation priority. The THP furthermore, gives a comprehensive list of proposed mitigation measures along the Masonite Road, which is part the appurtenant road system. There are 34 additional road points along the appurtenant road system, pages 34.1-34.5, that are associated with other THPs but are disclosed here. The ECP is located on pages 261-266.

This THP has disclosed all the significant existing and potential erosion sites as well as sites that have significant sediment discharge. These terms are defined in 14 CCR 895.1 and are included below.

Significant Existing or Potential Erosion Site means a location where soil erosion is currently, or there are visible physical conditions to indicate soil erosion may be in the future, discharged to Watercourses or lakes in quantities that violate Water Quality Requirements or result in significant individual or cumulative adverse Impacts to the beneficial uses of water.

Significant Sediment Discharge means soil erosion that is currently, or, as determined based upon visible physical conditions, may be in the future, discharged to Watercourses or lakes in quantities that violate Water Quality Requirements or result in significant individual or cumulative adverse Impacts to the beneficial uses of water. One indicator of a Significant Sediment Discharge is a visible increase in turbidity to receiving Class I, II, III, or IV waters.

The RPF has been found to be in conformance with 14 CCR 916.4(a)(1) which states the following:

*...The plan shall identify such conditions, including where they may interact with proposed Timber Operations, that individually or **cumulatively significantly and adversely affect the beneficial uses of water**, and shall describe measures to protect and restore to the extent feasible, the beneficial uses of water. In proposing, reviewing, and approving such measures, preference shall be given to measures that are on-site, or to offsite measures where sites are located to maximize the benefits to the Impacted portion of a Watercourse or lake(emphasis added).*

CAL FIRE concurs with the two findings found on page 132 of the THP for Sediment and Water Temperature. Of particular importance is the discussion on page 131 -132 regarding sediment

April 1, 2022

within the cumulative impact assessment area, which concludes on page 132, "The proposed THP operations and mitigations attain the goal of net sediment reduction leading to minimization of controllable sediment sources....In fact, significant beneficial sediment watershed effects relating to sediment are expected because of the reduction in controllable sediment sources that would not otherwise be corrected."

NCRWQCB sets the TMDL, and are the authority on TMDL. The plan does adhere to 14 CCR 923.1 (e)(1) and (2). Page 6 of PHI report generated by NCRWQCB states the following.

If the review team recommendations, including those of the Regional Water Board, are incorporated into the THP, once approved, the THP will be likely to avoid or minimize both short term and long-term adverse impacts to beneficial uses of water. When considered with the proposed silviculture, the requirements for post-harvest retention of overstory canopy, and watercourse and lake protection zone requirements, the plan will likely comply with applicable water quality standards and therefore will be eligible for coverage under the Order. (Emphasis added)

Due to these mitigations and protection measures, and considering the requirements outlined in the Forest Practice Rules it has been determined that the proposed project as presented will not cause or add to significant cumulative impacts to sediment and temperature within the Big River watershed, follows the FPRs, and can reasonably be assumed to adequately consider and protect downstream beneficial uses.

Subject: Comments – 1-20-00218 MEN, Russell Brook, 1-21-0096 Daugherty Creek/Snuffins Creek

Dear Review Team

These comments are process comments (commission and omissions) related directly to issues for Director disapproval of these projects.

BACKGROUND

Both of these proposed THPs are in the Big River watershed. Big River is listed as impaired (California's List of Water Quality Limited Segments- 303 (d) list) by the pollutants sediment and temperature. These THPs fail to address requirements (under noted Authorities - below) for approval. The discussion (below) will demonstrate these failures – that must be corrected prior to approval of the plans.

Both of these plans are subject to an EPA TMDL for Sediment. No TMDL has been set for temperature impairment (though one is due). Neither plan discusses, or demonstrates any assurance in the plan of meeting sediment reduction requirements (per the EPA TMDL sediment reduction targets and Basin Plan Requirements under Non-Point Source Policy – Basin Plan language). There is no temperature TMDL (as stated); however requirements of the Basin Plan non-point source policy language have not been met for the pollutant temperature. The issue with both pollutants, Sediment and Temperature, is that data and discussion necessary to assure pollutant reduction to attain water quality standards and appropriate habitat conditions must be extant in the plan. This data is not included in either plan, nor are the verified means of attainment of water quality standards described and discussed in the plan. This is a violation of the FPRs (see authorities below), Cal Water Code, Non-point Source Policy, and CEQA.

It should be noted that failure to supply such monitoring, or data, precludes determination (findings) of Plan compliance with Water Quality Control Plans (WDRs, Waivers, TMDLs, and the Basin – including non-point source requirements).

RECEIVED

AUG 06 2021

**COAST AREA OFFICE
RESOURCE MANAGEMENT**

AUTHORITIES: Forest Practice Act and Rules, Cal Water Code (including regional Water Quality Control Plan/Basin Plan), California Environmental Quality Act (CEQA).

1) The Forest Practice Act and the Forest Practice Rules stated objective is consistency with the Porter Cologne Water Quality Control Act, regional Basin Plans - including protection and recovery of aquatic resources

2) Porter Cologne Water Quality Control Act, Water Code Section 13160, objective of consistency with the Federal Clean Water Act mandates must be met.

3) Under Porter Cologne, the MAA, the Forest Practice Rules, THP administration must meet Basin Plan (including non-point source and anti-degradation requirements):

State Anti-degradation Policy (Basin Plan, Chapter 3, Water Quality Objectives):

"Controllable water quality factors shall conform to the water quality objectives contained herein. When other factors result in the degradation of water quality beyond the levels or limits established herein as water quality objectives, then controllable factors shall not cause further degradation of water quality. Controllable water quality factors are those actions, conditions, or circumstances resulting from man's activities that may influence the quality of waters of the State and that may reasonably be controlled."

Nonpoint Source Policy (*found at the SWRCB web site and in the regional Basin Plan*)

Many water bodies in the North Coast Region are impaired by nonpoint sources (NPS) of pollution, such as sediment discharges and elevated water temperatures. The Policy for the Implementation and Enforcement of the Nonpoint Source Pollution Control Program (NPS Policy)¹⁴ is a state-wide policy that explains how existing permitting and enforcement tools will be used to address nonpoint sources of pollution. The NPS Policy states that all current and proposed NPS discharges must be regulated under waste discharge requirements (WDRs), waivers of WDRs, a basin plan prohibition, or some combination of these tools. A NPS pollution control implementation program is a program developed to comply with WDRs, waivers of WDRS, or basin plan prohibitions. A NPS pollution control implementation program must contain five Key elements, which are summarized as follows:

Key Element 1: Explanation of the purpose of the NPS pollution control implementation program and how it will meet water quality standards.

Key Element 2: Description of the management practices and other program elements that are to be used to meet water quality standards and an evaluation that ensures proper implementation.

Key Element 3: A time schedule with quantifiable milestones.

Key Element 4: Adequate monitoring.

Key Element 5: The potential consequences for failure.

Neither of these plans provides information, data, monitoring, or other information that complies with the Basin Plan NPS Policy Elements called for in the Basin Plan (or WDRs, Waivers, EPA TMDL sediment targets, or any implied controls to limit (or improve) temperature conditions.

4) Forest Practice Rules Section 916.9 (a) (1) states:

(a) Every timber operation shall be planned and conducted to protect, maintain, and contribute to the restoration of properly functioning salmonid habitat and listed salmonid species. To achieve this goal, every timber operation shall be planned and conducted to:

(1) Comply with the Terms of a Total Maximum Daily Load. (et sec)

Note: this rule [916.9 (a) (1)] states CDF responsibility to enforce Basin Plan Guidelines as well as TMDL mandates.

As stated in the FPRs and the Act, the intent of the administration of the Act and Rules emphasize the protection and recovery of water quality resources (along with and interagency agreement to accomplish this requirement). Thus each and every THP must demonstrate how such compliance is assured (in the case of impaired waters, additional actions are necessary to demonstrate compliance – as noted in TMDLs, State Non-point Source Policy and other noted authorities). Furthermore, the FPRs (including ASP rules – where ASP is found by NOAA Fisheries to not be fully protective) as applied in these THPs are minimum (baseline) protections that may not (do not) meet the requirements of the above noted authorities (unless justified by sufficient monitoring over time showing improvement - as movement towards attainment of water quality standards) and that there are sufficient management plans, with timelines, in place to assure continued recovery (also to be justified/verified with evidence supplied by monitoring).

The above regulatory framework is stated in this letter for grounding in the discussion that CDF must accept stated responsibility of its mission to protect water quality values (through all of the above) in exercising its lead agency responsibility.

898.2 Special Conditions Requiring Disapproval of Plans

The Director shall disapprove a plan as not conforming to the Rules of the Board if any one of the following conditions exist:

(c) There is evidence that information contained in the plan is incorrect, incomplete or misleading in a material way, or is insufficient to evaluate significant environmental effects. The sufficiency of the information provided in the THP to evaluate significant environmental effects

shall be judged in light of what is reasonable and necessary.

(h) Implementation of the plan as proposed would cause a violation of any requirement of an applicable water quality control plan (Basin Plan) adopted by the State Water Resources Control Board (this would include State Non-point Source Policy – which is also in the Basin Plan).

Big River Total Maximum Daily Load for Sediment - EPA Region 9

The TMDL discusses the watershed condition(s) and characteristics, watershed habitat conditions for salmonids, water quality standards, summary of water quality indicators and targets, sources of sediment (separated background loading and loading aggravated by land use – timber harvest), and the TMDL (reductions of pollutant inputs needed to attain water quality standards).

Monitoring information in either THP is insufficient (in some cases totally not present) indicating current status of targets or movement (trends) towards the improvement in the suite of Indicator Targets (noted in the TMDL) – for the pollutants sediment or temperature. Nor, do the plans demonstrate or assure movement (recovery) in the direction of improved conditions. However, the TMDL does provide a baseline (indicators related to sediment) for sampling.

The source analysis indicates that management activity is responsible for significant percentage of sediment inputs above background levels.

The TMDL sets the total sediment loading capacity at 125% of background sediment delivery.

LOAD ALLOCATIONS FOR NONPOINTSOURCES (MANAGEMENT-ASSOCIATED LOADS) – with a loading reduction needed of 75% (Cumulative Reduction – from land use/timber operations). This is broken down by source and activity in Source Analysis in the EPA TMDL (pp. 28,29)

These THPs (all of MRC THPs) summarize sediment reduction activity – with numbers (usually noting the total cubic yards of sediment controlled). However, they do not show (via monitoring or work verification) that the numbers they are presenting are meeting the required standards/target for attainment of water quality standards. There is no baseline presented from which to make assessment. Nor is relevant data presented showing sediment production potential (existing controllable sources and potential sources and sources from roads, skid trails and disturbance from operations, amount sediment controlled, the amount of sediment reduction over time (as opposed to the sediment produced from roads and harvest activity). The very same issue arises with the pollutant –temperature. There is no base line monitoring data or monitoring data showing trends. Thus, rational assessment of progress in the attainment of water quality standards is impossible and the public and review team are deprived of information/data presented in a form that would allow for appropriate and rational decision making.

There is no data presented on the issue of temperature. Both THPs claim that trees marked for

removal will not worsen temperature conditions (where the impaired listings show stream temperatures to be out of the range that would support salmonid survival in all life stages). This information does not meet the required analysis and data presentation required by: 1) the rules for Director decision, 2) Basin Plan (inclusive of non-point source language), 3) CEQA, 4) Big River TMDL sediment reduction targets.

These plans do not meet the legally required standards of disclosure, discussion and control of all sediment and temperature sources. (in compliance with non-point source policy, CEQA, and the FPRs)

Elements of an Erosion Control Plan (ECP must include and assess)

Each plan must include an Erosion Control Plan. Though in the case of these THPs the ECPs are incomplete – missing baseline data, data from road surface erosion and road precipitated landsliding or other failures. Additionally absent from the THPs are instream monitoring noting trends in sediment delivery and/or evidence of recovery.

At a minimum and ECP should include:

Baseline Data Inventory A Baseline Data Inventory includes an ownership-wide (or planning watershed) inventory of Sediment Delivery Sites. Sediment Delivery Sites are controllable, human-caused erosion sites that are currently eroding or have the potential to erode in such a manner as to deliver measurable amounts of sediment. The inventory should include such features as undersized culverts, culverts with diversion potential, eroding sidecast or fill, downcutting inside ditches, etc. The Baseline Data Inventory shall include a description of all active and potential sediment sources resulting from roads, landings, skid trails, timber operations and agricultural operations, and other significant human-caused earth movement activities that have or might have the ability to enter waters of the state.

The Baseline Data Inventory shall include, at a minimum:

- A description of the inventory method used;
 - A topographic map with 80 foot intervals showing the ownership boundary and the location of all inventoried sites, as well as roads and drainages; and
 - For each site, an estimate of the volume of sediment and the relative potential for sediment delivery. The Baseline Data Inventory must be comprehensive and may follow as examples, completely or in part, the inventory methods described in the Assessment and Implementation Techniques for Road-Related Sediment Inventories and Storm-Proofing. (e.g. William Weaver, of Pacific Watershed Associates, Inc.); the *STAR* Worksheet system of the Watershed and Aquatic Habitat Assessment (September 29, 1997,) Inventory and Monitoring Worksheet developed by U.C. Davis (1998).
2. Sediment Reduction Schedule)

The Sediment Reduction Schedule shall describe how and in what order of priority the sediment discharges from the Sediment Delivery Sites identified in the Baseline Data Inventory will be reduced in accordance with the schedule set forth in an Implementation Schedule section.

The Baseline Data Inventory shall be used when prioritizing and conducting sediment delivery reduction activities, and the highest priority for sediment delivery reduction shall be assigned to those sites with the greatest potential to discharge sediment to a watercourse that supports fish.

Assessment of Unstable Areas

The Assessment of Unstable Areas shall identify through modeling, data analysis and/or a field inventory, areas of instability across the property. Unstable Areas are areas with a naturally high risk of erosion and areas or sites that will not reasonably respond to efforts to prevent, restore or mitigate sediment discharges. Unstable Areas are characterized by slide areas, gullies, eroding stream banks, or unstable soils that are capable of delivering sediment to a watercourse. Slide areas include shallow and deep seated landslides, debris flows, debris slides, debris torrents, earthflows, headwall swales, inner gorges and hummocky ground. Unstable soils include unconsolidated, non-cohesive soils and colluvial debris.

The Assessment of Unstable Areas shall include, at a minimum:

- All known active and potential shallow and deep-seated landslides, debris flows, debris slides, debris torrents, earthflows, headwall swales, inner gorges, and unstable soils.
- All known active or potentially active gullies and streambank erosion sites, as appropriate, but should not include the sites identified in 1. above. Preparers of the Assessment of Unstable Areas may but are not required to use existing California Department of Conservation maps such as the series entitled "Geology and Geomorphic Features Related to Landsliding" or a digital terrain-type model like the one developed by Louisiana Pacific Corporation in its draft Sustained Yield Plan for Coastal Mendocino County (1997) in combination with field-based maps of Unstable Areas

Monitoring Plan

The Monitoring Plan shall describe the method for monitoring the effectiveness of the sediment control efforts the landowner has implemented for the Sediment Delivery Sites identified in the Baseline Data Inventory. The monitoring method must be consistent with the submitted Baseline Data Inventory method so that results are comparable from year to year. The results of the sediment control efforts and any other erosion control related activities, including the implementation of land management measures, shall be included in the plan and submitted to the Regional Water Board in an annual report.

In addition, the landowner (MRC) should establish instream monitoring points above and below any significant land management activity on their properties and in potential anadromous fish refugia – to track and validate compliance with non-point source, water code, basin plan, TMDL, and CEQA requirements.

As noted above: The absence of monitoring (including noted baseline conditions) makes

determination of compliance with a TMDL, WDR or Waiver, or Basin Plan (including non-point source requirements) – impossible.

WATERSHED CONDITIONS (EPA TMDL)

In general, the most sensitive beneficial use in the Big River watershed – protection of the cold water fish species is impaired by poor quality summer rearing and overwintering habitat conditions, excess sediment, lack of deep pools, fair to poor spawning gravels (primarily embeddedness), low large woody debris (LWD) volume, low availability of canopy, high temperatures, and a lack of connection to off-channel habitat (NCRWQCB 2001a, 2001b). Excess sediment is adversely impacting the number and volume of pools. Sediment is also causing moderate to high embeddedness of substrate and spawning gravels in the basin. Recently-increased road building and timber harvest activities may cause additional degradation in the future, although the impacts are not yet reflected in current stream habitat conditions.

Throughout the South Fork Big River, pools are shallow and spawning gravels are embedded. Canopy cover is low and water temperatures are high. In Chamberlain Creek, stream channels are entrenched and have low volumes of LWD. Pool depths are shallow, and embeddedness is high. Sediment inputs are high and canopy cover is low.

Lower Big River PW. Generally speaking, there is little change apparent in the lower reaches of the estuary. Further upstream, visible changes include channel narrowing by riparian vegetation encroachment onto what were formerly exposed alluvial deposits or former mudflat areas. The number of roads has noticeably increased, a modest amount of residential development has occurred, and the overall age and density of the forest stands appear to have increased. In one photo, the average width of the roads has increased along with increased numbers of turnouts and landings. Extensive areas of timber harvest were visible in some areas, along with a high density of skid trails.

The EPA TMDL notes that the Road Density in the mainstem is approx. 7 mi/mi² and Daugherty Creek approx. 6 mi/mi². These are high road densities and by all accounts in all the literature are a major factor not considered (calculated in a sediment budget) with the inclusion of total sediment production estimates from roads skid trails and disturbance from operations. (this is not consistent with requirements to disclose and estimate outcomes of management necessary to establish progress towards attainment of water quality standards)

Native surface roads were 83% of the total, followed by rocked roads at 14%,

Approximately 20% of the current loading (78 t/mi²/yr) is allocated to management-associated nonpoint sources (management-related landsliding, skid-trail surface erosion and road surface erosion).

Background sources comprise 80% of the load allocation (315t/mi²/yr), including non-management landsliding, soil creep, and fluvial erosion.

The TMDL analysis determined that road and skid trail related sediment sources are approx. 18% of the total TMDL allocation and where the reduction target is 70%.

This issue is raised as there is no estimate, number, or calculation of the road and skid trail potential, or actual, sediment input. The same issues arise in the THP analysis of stream conditions – where there is some data on current conditions – with no data on baseline conditions or changes over time - trends.

This scenario is also mimicked in discussion of the pollutant temperature – where there is no data presented representing baselines, current conditions, or trends.

How could one determine which way things are going? Or – even get an accurate picture of current conditions and how they fit with habitat needs and progress towards target attainment?

CEQA

CEQA requires full disclosure of conditions in the plan (inclusive of historic and current watershed conditions), activities to be undertaken, potential impacts of activities, and actions taken to remedy potential impacts, and a monitoring plan to assure compliance. Due, to the impaired status of Big River and actions needed to be taken to attain water quality standards – there must be baseline data and a description of actions that will assure compliance with noted recovery targets. These items and related discussion and remedies are absent from these THPs.

Conditions as stated in each Plan (what is there and what is not there)

We know that the watercourse conditions in Big River are not meeting water quality standards (not supporting beneficial uses and not meeting water quality objectives).

The EPA TMDL assigns an amount of pollutant loading (sediment) to roads, skid trails, and timber harvesting operations (disturbance from timber harvesting – including compaction from the roads and skid trails + timber operations that leads to increased runoff and peak flows – or diminished time to peak flow – which indicates increased, and concentrated, hydraulic energy which causes more failures and sheet and rill erosion.). The studies in Casper Creek (Cafferata and Reid) and the literature (Klein et al and other literature) all support this conclusion. Neither THP includes data that would support necessary determinations, or findings that can support conclusions that are displayed in the THPs. The failure to include such data and analysis is inconsistent with what is required by the noted authorities (necessary data would include – inventories of sediment sources and potential sediment sources, accounting for total sediment inputs vs remedies applied, stream conditions from baseline to current conditions, and/or changes in conditions over time). Thus, these THPs fail to supply a full description of the plan (conditions related to the plan), and there is no way to determine if progress is being made towards attainment of water quality standards and/or if the mitigations noted in the THPs are sufficient to move the watercourses towards recovery in any reasonable period of time.

These watercourses appear in no better condition than they were over 20 years ago (when they

were listed as impaired). There are no demonstrated changes in stream conditions in almost that same period of time from when the Threatened and Impaired Rules, followed by ASP, were put in place.

Additionally; NOAA Fisheries states that the T & I rules, and ASP, are not fully protective. Though, they do say that these rules are an improvement over the standards FPRs.

1-20-00218 MEN, Russell Brook

This THP does note Big River (and tributaries) are listed as impaired (sections 2,3, and 4).

There are point in time monitoring results for some sediment affected conditions included in the plan. There is an absence of baseline data, or data over time from which trends can be determined. There are no calculations regarding how much sediment is produced from operations, disturbance, roads, or the 82 stream crossings and culverts noted in the plan. Roads are not even mentioned as ongoing or potential sediment sources.

The ECP discussion estimates the removal of 1200 cubic yards of sediment. There is no sediment budget assessing the potential sediment inputs from the sources noted above. Thus, there can be no determinations made in regards to compliance with the stated FPRs, Cal Water Code, Basin Plan non-point source requirements, EPA TMDL targets, and/or CEQA requirements for disclosure of potential effects of the proposed plan.

The plan discloses no temperature data at all (Note: Temperature is a controllable pollutant). Section 3 (p. 108) Water Temperature Effects – states that the mitigations in Section 2, #26 are sufficient, or even beneficial. Section 2, #26 applies the standard ASP management constraints. There is a statement that the temperature mitigations (standard ASP rules), as applied, may be beneficial. Again, no temperature data is supplied and there is no justification or valid basis for this statement.

1-21-0096 Daugherty Creek/Snuffins Creek

The plan does note the watershed is impaired by the pollutant – sediment. The plan fails to note impairment by the pollutant temperature.

There is some monitoring of stream habitat conditions and sediment substrate conditions. (current point in time data). There are no baselines provided and no evidence of improving conditions (over time) – for either pollutant – temperature or sediment.

For the pollutant sediment, there are no calculations of total sediment potential inputs from operations, roads and skid trails (and other sources) and the quantities of sediment controlled (or removed) to offset the inputs. The plan notes the construction and reconstruction of 6682 feet of road (some in areas of existing trails or historic road prism). No number of sediment production is attached to the road construction/reconstruction. There is no estimate (or calculation, or data to demonstrate trends) on how sediment production and/or control methods meet EPA TMDL targets, comply with Basin Plan non-point source requirements, CEQA disclosure

requirements. There is a “Finding” that the THP minimizes sediment production by controlling sources. There is no evidence supplied to support this finding.

This plan fails to note that Big River watershed (and tributaries) are impaired by the pollutant temperature. There is no temperature data provided at all. The plan includes a “Finding” that stream buffers (ASP) as provided will set a high level of shade that will moderate temperature effects. No evidence is provided to support this statement.

Conclusion

These two Timber Harvest Plans can not be approved by the Director until the necessary data and information are provided in the plan for the informed decision making process and consistent with the noted authorities.

Alan Levine

For Coast Action Group

Letter(s): National Marine Fisheries to the Board of Forestry 2009,2006 commenting on Threatened and Impaired Rules and Anadromous Salmonid Protection Rules (attached)

23 CCR § 2915

§ 2915. Policy for the Implementation and Enforcement of the Nonpoint Source Pollution Control Program.

On May 20, 2004, the State Water Resources Control Board (SWRCB) adopted Resolution No 2004-0030, adopting the Policy for the Implementation and Enforcement of the Nonpoint Source Pollution Control Program(NPS Implementation Policy) in accordance with California Water Code section 13369.

A nonpoint source (NPS) pollution control implementation program is a program developed to comply with SWRCB or RWQCB waste discharge requirements (WDRs), waivers of WDRs, or basin plan prohibitions. The policy provides a framework for developing NPS pollution control programs throughout the state. NPS pollution control programs may be developed by the SWRCB, a RWQCB or a third-party entity. The policy defines “third-party entities” as entities that are not actual dischargers under RWQCB/SWRCB permitting authority.

All NPS pollution control programs endorsed or approved by a RWQCB as sufficient to meet RWQCB obligations to protect water quality are required, at a minimum, to meet the requirements of the following key elements, thus providing consistent program requirements throughout the state.

1. A NPS control implementation program's purpose must be explicitly stated, and must be designed to achieve and maintain water quality objectives and beneficial uses, including any applicable antidegradation requirements.
2. The NPS program shall include a description of the management practices to be implemented and the process to ensure and verify proper implementation.
3. Where a RWQCB determines time is necessary to achieve water quality requirements, a time schedule and corresponding quantifiable milestones to measure progress are required.
4. Feedback mechanisms must be included in the implementation program so that the RWQCB, dischargers and the public can determine whether the program is achieving its stated purpose(s), or if additional or other actions are required.
5. In addition, each RWQCB shall make clear, in advance, the potential consequences for failure to achieve a program's stated purposes and make clear that any enforcement action that needs to be taken will be taken against individual dischargers, not the third parties.

Investigation, identification, and enforcement of NPS discharger noncompliance with State water quality control laws, regulations, policies and plans shall be consistent with the requirements of the State Water Resources Control Board Water Quality Enforcement Policy (Title 23, California Code of Regulations section 2910).

HISTORY

1. New section summarizing "Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program," Resolution No. 2004-0030 adopted 5-20-2004 by the State Water Resources Control Board; approved by OAL and effective 8-26-2004 pursuant to Government Code section 11353; filed 8-26-2004 (Register 2004, No. 35).

NATIONAL MARINE FISHERIES SERVICE
Southwest Region
501 West Ocean Boulevard, Suite 4200
Long Beach, California 90802-4213

September 8, 2009

In response refer to:
SWR/F/SWR3:CAA

Mr. Stan Dixon
Chair, California Board of Forestry and Fire Protection
P.O. Box 944246
Sacramento, California 94244-2460

Dear Chairman Dixon:

This letter from NOAA's National Marine Fisheries Service (NMFS) is in response to the State Board of Forestry and Fire Protection's (BOF), July 24, 2009, 45-day Rule Re-notice (Rule Notice) and requests for comments and assistance regarding the development of the BOF Anadromous Salmonid Protection Rules, 2009 (previously named Threatened or Impaired Watershed Rules, 2009 [T/I rules]). NMFS appreciates the invitation and opportunity to participate in the BOF appointed Technical Advisory Committee (TAC), literature review process, Forest Practice Committee and BOF meetings of the last 2 ½ years leading up to this Rule Notice.

NMFS would like to take this opportunity to acknowledge the work by the BOF/TAC staff and Chair, Mr. Chris Zimny, Mr. Pete Caffereta and Mr. Gary Nakamura. The February 2009 proposed rule prepared primarily by Mr. Caffereta and Mr. Zimny was the outcome of the TAC process, well-done and science-based. The July 24, 2009, Rule Notice includes a number of significant changes to the February 2009 BOF staff proposal per requests of BOF members during Forest Practice Committee meetings and BOF meetings. In addition, changes and improvements have been incorporated into the proposed Rule Notice based on recommendations by California Department's of Forestry and Fire Protection (CalFire) and Fish and Game (CDFG). The BOF staff report of 2008 outlines that the formulation of the TAC and the literature review process involved was intended "as a pilot for developing science-based information for regulation development...and...to be highly transparent involving stakeholders, scientists and other responsible government agencies". NMFS found Mr. Zimny and Mr. Caffereta, in all cases, endeavoring to meet that goal.

According to the BOF, changes to the T/I Rules are warranted to (1) protect and restore habitat conditions for coho salmon and other anadromous salmonids in California river systems, (2) increase fish population abundance and (3) improve the conservation status of threatened salmonid species. NMFS concurs that changes to the T/I rules are warranted and directs the BOF to refer to NMFS' previous communications with the BOF on T/I Rules; in particular the NMFS June 22, 2009 letter to the BOF regarding the May 8, 2009 T/I 45-day Rule Notice.

RECEIVED

AUG 06 2021

**COAST AREA OFFICE
RESOURCE MANAGEMENT**

Noticed Rules

NMFS is concerned that the current Rule Notice contains modifications and optional amendments proposed by BOF members that lack a scientific basis and depart significantly from the February 2009 BOF staff proposal. Several most notable changes include: (1) reduced riparian canopy retention standards for all watercourses including the option of an angular canopy density versus overstory canopy standards; (2) increasing Quadratic Mean Diameter of riparian zone trees to only commercial thinning and the deletion of a minimum basal area retention standard in Class I zones; (3) removed linkages to the biological and physical characteristics of the floodprone area; (4) greater allowances for timber activities closer to watercourses (e.g., road-building; use of heavy ground-based equipment); (5) options not to adopt Class II and III watercourse protections and (6) allowance of variances from standard operating provisions absent a comprehensive understanding of watershed processes and adequate multi-agency review.

Status of Salmonids and Actions to Prevent Their Extinction

Nearly all of California's salmon and steelhead are critically at risk of becoming extinct in the foreseeable future. For millions of years salmon and steelhead have successfully persisted in abundance often under catastrophic and shifting environments (e.g., marine mammal predation, prolonged drought, uncontrolled wildfires, marine and freshwater conditions, changing climate, etc). However the human configured landscape developed over the last two centuries and harvest pressures have expanded. Thus, the persistence and recovery of salmonids (and the sustainability of our natural resources) will require re-thinking our land and water resource conservation values to work towards a mutual benefit to both mankind and the environment. NMFS acknowledges that a full suite of land/water use activities, including forestry practices on private lands, and direct take of salmonids significantly affect persistence of salmon and steelhead in California.

To that end, Federal, State and local entities are enacting laws and policies to prevent extinction and develop a plan for their recovery. Actions are occurring across both freshwater and marine environments to include among many others:

- ☐ The State of California and NMFS, on recommendation of the Pacific Fishery Management Council, issued a closure on all commercial offshore fishing for salmon;
- ☐ NMFS' Biological Opinion for the Central Valley Project and the State Water Project advises the Bureau of Reclamation and the Department of Water Resources to provide fish passage above Shasta, Folsom and Nimbus dams to ensure avoidance of jeopardy to Central Valley salmonids;
- ☐ Discussions regarding the removal of the Klamath dams and restoration of the Klamath Basin;
- ☐ Freshwater fishing regulations to be proposed by NMFS and supported by a number of fishing organizations for the central coast of California that include low flow and timing closures; and

- ❑ The development of Habitat Conservation Plan (HCP's) for industrial timber companies, which are targeted at sound timber management practices and the conservation of anadromous salmonids on nearly 780,000 acres of forest land in northern California.

No single entity can recover salmon and steelhead in California; actions must be unified and strategic. However, the forestlands of California play a critical role for ensuring freshwater survival and the likelihood of long term recovery of salmonids. The decisions by this BOF will have a significant influence on the future of California's salmon.

Noticed Rules and Habitat Conservation Plans

The State of Washington and several industrial timber companies in California have, or are seeking, for their forestry operations a section 10(a)(1)(B) permit (e.g., habitat conservation plan [HCP]) that authorizes incidental take of listed salmonids under the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*). Staff from the NMFS Southwest Region, California, reviewed the standard prescriptions under these HCPs and coordinated with the NMFS Northwest Regional Office staff from Washington and Oregon regarding the Washington State Forest Practice HCP and other forest landowner HCPs. NMFS found the following in regards to the current Rule Notice before the California BOF:

- ❑ The July 24, 2009, BOF Rule Notice contains substantively less protective standards for salmonids for nearly all watercourses than those standards under west coast forestry HCPs that authorize incidental take of federally listed salmonids.
- ❑ Decisions regarding timber harvest operations and riparian protection under these HCPs are the outcome of data collection, watershed analysis and monitoring. In a number of cases, riparian protections for timberlands with HCPs have become more restrictive than the initial standard because watershed analysis information indicates a significant deficiency in properly functioning aquatic conditions for salmonids (e.g., expanded no harvest Class I's due to critical lack of large woody debris).
- ❑ Extensive monitoring is conducted in Washington that informs a Washington State Department of Natural Resources comprehensive database that includes an updated and standardized set of information and mapping tools regarding salmonids, their habitats and upslope/watershed conditions. This information system is publicly available and used by landowners, foresters, agencies, tribal representatives, and others to inform harvest planning and review. No such comprehensive and standardized information system regarding salmonid habitats currently exists for California's forestlands.
- ❑ The ESA section 7 consultation and biological opinions for these HCPs provide a context describing how forest management practices and/or the measures of the HCP are anticipated to affect processes that support salmonid habitats (e.g., sediment introduction to streams, large wood recruitment, canopy as an influence on instream temperature conditions, etc.).

Taking into consideration these analyses, the current BOF Rule Notice (optional amendments inclusive) and the lack of a statewide watershed analyses program, NMFS advises the BOF take

the most conservative approach and avoid approving Rules that may allow the unauthorized take or harm to California's salmon and steelhead.

Noticed Rules and the Listing of Northern California Steelhead on June 7, 2000

The administrative record outlining the process and final adoption of the current T/I Rules in March 2000 (now termed the Anadromous Salmonid Protection Rules, 2009) and the inadequacy of the current rules is detailed in the Northern California steelhead Federal Register Notice (FRN) of June 7, 2000 (65 FR 36074). The new title of the Rule Notice (e.g., Anadromous Salmonid Protection Rules, 2009) was changed between the May 8, 2009, 45-day Rule notice and the July 24, 2009, 45-day Rule notice. The specific inadequacies of the Forest Practice Rules to provide for salmonids is outlined in 65 FR 36074 and include: "(1) protective revisions that are not supported by scientific literature; (2) provisions that are scientifically inadequate to protect salmonids including steelhead; (3) inadequate and ineffective cumulative effects analyses; (4) dependence upon registered professional foresters (RPFs) that may not possess the necessary level of multidisciplinary technical expertise to develop THPs protective of salmonids; (5) dependence by CDF on other State agencies to review and comment on THPs; (6) failure of CDF to incorporate recommendations from other agencies; and (7) inadequate enforcement due to staffing limitations. NMFS further concluded that until a comprehensive scientific peer review process was implemented and appropriate changes to the Forest Practice Rules and the THP approval process were made, properly functioning habitat conditions would not exist on non-Federal lands in the northern California steelhead ESU." NMFS recommends the BOF determine which measures from the current Rule Notice can fulfill the issues outlined in the FRN and those outstanding and to devise a timeline to discuss and resolve those issues to ensure these Anadromous Salmonid Protection Rules are meeting their full intent.

NMFS Recommendations

NMFS recommends the BOF adopt highly protective Rules and make them permanent on September 9, 2009. We recommend the BOF include Optional Amendments 20, 21, 22, 23, and 107 in the Anadromous Salmonid Protection Rules. We oppose the adoption of Optional Amendments 9, 26, 27, 100, 101, 102, 103, 104, 105, and 106 as these would not provide sufficient protection of salmonids and their habitats and may, in combination with other activities, increase the likelihood and risk of unauthorized harm and take of anadromous salmonids. At this time, the Central California Coast coho salmon Evolutionarily Significant Unit is critically at risk of extinction. Reduced protections on forestlands could result in accelerated localized extinctions.

For the last 10 years, NMFS representatives have been recommending the BOF develop either no-take rules (e.g., similar to those for the federally listed northern spotted owl and marbled murrelet) or move forward on the development of a section 10(a)(1)(B) statewide permit (e.g., habitat conservation plan [HCP]) that authorizes incidental take of listed salmonids under the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*). Adopting the most protective proposed rules would be a step in the right direction towards the development of an HCP and ESA compliance. However NMFS finds the proposed Anadromous Salmonid Protection Rules are not no-take rules, are unlikely to meet the intent of the Rules themselves and are not likely to abate the risk of extinction for listed salmonids where these Rules are implemented.

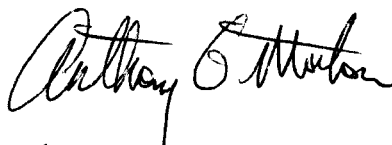

As described in the June 22, 2009, letter to the BOF, NMFS supports the concept of conducting watershed analysis and assessment for a spatially explicit management alternative but recommends the BOF not adopt this alternative at this time. NMFS recommends the BOF develop a structured process, establish a system similar to Washington State and work through the appropriate Federal processes (*e.g.*, HCP) that provide for alternative management planning without risk of unauthorized incidental take or harm to federally listed salmonids. NMFS additionally recommends the BOF not adopt the Class II measures outlined for the Southern Subdistrict of the Coast Forest District at this time.

Even the most protective measures in the proposed Anadromous Salmonid Protection Rules are still less protective than timberland operations that have secured NMFS' authorization for incidental take under HCPs. NMFS recommends CalFire, landowners and timber harvest plan submitters ensure compliance with the ESA in approving, and operating under, CalFire approved timber harvest plans. To this end and depending on the decision of the BOF, NMFS is intending to re-initiate discretionary reviews of timber harvest plans (including post harvest reviews) and become more engaged in pre-harvest inspections and the timber harvest approval process. NMFS' goals in participating will be to ensure no take or harm occurs to federally listed salmonids and that the habitats supporting salmonid essential behavioral patterns such as spawning, rearing, migrating, feeding, etc. are not being impaired through timber operations.

NMFS urges the BOF to adopt Rules that provide the greatest possible protections to anadromous salmonids and their habitats. This action would (1) set the stage for furthering the discussions regarding a statewide HCP initiated by the California Natural Resources Agency in 2006 and (2) increase assurances that industrial and non-industrial forest landowners without an HCP are not subject to discretionary timber harvest reviews by NMFS.

Thank you and if you have any questions or would like to meet with staff regarding comments in this letter please contact Charlotte Ambrose at (707) 575-6068.

Sincerely,

 Rodney R. McInnis
Regional Administrator

June 22, 2009

In response refer to:
SWR/F/SWR3:CAA

Mr. Stan Dixon
Chair, California Board of Forestry and Fire Protection
P. O. Box 944246
Sacramento, California 94244-2460

Dear Chairman Dixon:

This letter from NOAA's National Marine Fisheries Service (NMFS) is in response to the State Board of Forestry and Fire Protection's (BOF), May 8, 2009, 45-day Rule Notice (Rule Notice) and requests for our assistance regarding the Threatened or Impaired Watershed Rules (T/I rules) that will apply to watersheds with federally listed anadromous salmon or steelhead. According to the "Notice of Proposed Rulemaking for Watersheds with Threatened or Impaired Values" published May 8, 2009 these proposed rules are "...intended to protect listed anadromous salmonids and their habitat in forest settings." NMFS appreciates the opportunity to comment on the Rule Notice and provide information to the BOF regarding the status of listed salmon and steelhead and the importance of adopting adequate protection measures to protect and conserve these species.

Rule Notice and current T/I Rule key points:

- ☐ Many populations of California's salmon and steelhead have experienced precipitous and prolonged declines, some are critically in danger of extinction [e.g., Central California Coast coho salmon Evolutionarily Significant Unit (CCC coho salmon ESU)];
- ☐ A large percentage of remaining salmon and steelhead spawning, rearing, migrating and feeding habitats occur on non-Federal forestlands.
- ☐ Approximately 85-90 percent of the last remaining populations of CCC coho salmon exist on private forestlands (NMFS GIS, 2009).
- ☐ The ability of a watershed to support healthy and abundant populations of salmon and steelhead is highly relevant to marine survival. Size, health and abundance of smolts from the freshwater environment are significantly correlated with marine survival (Bond 2006).
- ☐ California's forest practices have been found to not provide for the protection and conservation of salmon and steelhead and their freshwater habitats (Ligon *et al.* 1999).

- NMFS recommends the BOF ensure the intent of the current FPRs (e.g., protection of salmonids) is achieved and measures approved by the BOF address all FPR inadequacies outlined in the Federal Register Notice (FRN) 65 FR 36074. This FRN was the final notice listing Northern California steelhead Distinct Population Segment (NC steelhead DPS) as a federally threatened species. The listing of the NC steelhead DPS was largely due to the BOF approving only a portion of the 1999 T/I rule package and not fully implementing critically important conservation measures (e.g., Class II and III protections) to reduce threats from timber harvest activities as the State committed to do in a 1998 NMFS/California Memorandum of Agreement. The current BOF is advised to determine which measures from this FRN will remain outstanding and devise a timeline to discuss and resolve those issues to ensure FPRs fully meet their intent, and are protective of, NC steelhead and other listed anadromous salmonids.
- Absent a Federal Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*), section 10(a)(1)(B) incidental take permit and Habitat Conservation Plan (HCP), the legal standard for non-Federal timber harvest operations in California is “no take”. A no-take standard exists in the Forest Practice Rules (FPR) for other federally listed species potentially impacted by forest management activities (*i.e.*, northern spotted owl, marbled murrelet and California red-legged frog). This same no-take standard is not in place for salmon and steelhead. NMFS recommends the BOF adopt T/I Rules that are highly protective to provide assurances to California Department of Forestry and Fire Protection (CalFire) and forestry landowners that take or harm to salmonids will not likely occur as a result of a CalFire approved timber harvest plan.
- Portions of the current proposed Rule Notice are scientifically based and relevant standards for the protection of Class I, II and III watercourses. While falling short of a no-take standard, if the BOF adopts the most protective options in the package as a significant step to protect these critically imperiled species, it would set a foundation for development of a State Forestry HCP with NMFS.

Federal Status of Salmon and Steelhead in California

In California there are 10 distinct populations of salmon and steelhead (salmonids) listed as either threatened or endangered pursuant to the Federal ESA. Nine of the ten salmonid populations occur in watersheds where non-Federal forestland activities are implemented under California's FPR (Table 1):

Table 1: California's salmon and steelhead populations co-occurring with non-Federal forestlands

<i>Salmon or Steelhead Population</i>	<i>Federal Status</i>
Southern Oregon Northern California Coast coho salmon ESU (<i>Oncorhynchus kisutch</i>)	Threatened
Central California Coast coho salmon ESU (<i>O. kisutch</i>)	Endangered
Northern California steelhead DPS (<i>O. mykiss</i>)	Threatened
Central California Coast Chinook salmon ESU (<i>O. tshawytscha</i>)	Threatened
Central California Coast steelhead DPS (<i>O. mykiss</i>)	Threatened
South Central California Coast steelhead DPS (<i>O. mykiss</i>)	Threatened
Sacramento River Winter Run Chinook salmon ESU (<i>O. tshawytscha</i>)	Endangered
Central Valley Spring Run Chinook salmon ESU (<i>O. tshawytscha</i>)	Threatened
Central Valley steelhead DPS (<i>O. mykiss</i>)	Threatened

Federal Recovery Planning for Salmonids: Preliminary Findings

When species are listed and threatened or endangered under the Federal ESA, the agency is required to develop and implement a plan for their conservation and recovery. Recovery plans are in development for all federally listed California salmonids. Plans are targeted for public release in late 2009. Population data and criteria, developed by the NMFS Southwest Fisheries Science Center, set the population framework and criteria for the plans. Data currently being compiled and analyzed characterize current instream and watershed conditions and identify critical habitat impairments (*i.e.*, threats) to these species.

In general, preliminary findings from recovery planning indicate the following:

- ❑ **Status:** Chinook salmon and coho salmon are particularly in peril and are either at critically low levels or extirpated (no longer persisting) in many of their historical freshwater habitats. The reduced abundance of these species is of particular concern because small populations are at greater risk of extinction. As populations decline, environmental influences have a greater effect which cascades into further and more rapid population declines (Gilpin and Soule 1986, Pimm *et al.* 1988). Ocean harvest of Chinook salmon has been banned this year for both Oregon and California. Due to the dire status of CCC coho salmon, the priorities evolving from the draft recovery plan (to be released in September) is to outreach to key stakeholders (*e.g.*, forestry, county planning and water users) and prioritize restoration and threat abatement actions in order to prevent extinction.
- ❑ **Habitat Quality:** Survival through, and between, life stages are poor due to impaired habitats for egg survival and emergence, juvenile summer and over-winter rearing and smolt outmigration. Over-summer holding habitat for adult spring-run Chinook is additionally limiting. Generally, poor habitats are the result of a region-wide lack of complex pools/off-channel/floodplain habitats, high summer water temperatures, limited or diverted flow and excessive instream sediment. Access to upstream habitats is either moderately or significantly affecting the long-term survival of Southern Oregon Northern California coho salmon (SONCC coho salmon ESU) and Central Valley salmonids. Approximately 90-95 percent of the productive capacity of freshwater habitats to support salmonids has been lost due to human alterations.
- ❑ **Sources of Habitat Impairments:** Habitat impairment has been correlated with forest practice activities associated with roads and stream crossings, large and small tree removal along watercourse zones and on steep slopes, accumulated adverse effects associated with clearcutting and short re-entry periods, water drafting and timber conversions. We acknowledge other land use activities adversely impact salmonid habitats and these impairments cumulatively manifest as an unsuitable stream for salmonids (*e.g.*, channel modification, water diversion, impoundments, other land use practices and urbanization) and survival and transition through each life stage (*i.e.*, egg, alevin, juvenile, smolt and adult) becomes significantly diminished.
- ❑ **Ocean Conditions:** Salmonids have evolved under fluctuating ocean conditions for millions of years (Stearley 1992 *in* Moyle 2002) and have experienced precipitous declines in abundance over the last 150 years. The rate of change in the freshwater systems (due to human activities) has occurred at a rate greater than these species can evolve, thus, resulting in the current

population declines. Poor ocean conditions may have been the proximate cause for recent salmonid declines, but it must be recognized that the rapid, and likely temporary, deterioration in ocean conditions is acting in synchrony with the more recent 150 year steady degradation of the freshwater and estuarine environment. Poor ocean conditions should thus be viewed in the broader context of freshwater habitat degradation. An abundant and healthy freshwater population entering the ocean has a much higher likelihood of surviving marine conditions. As watersheds produce fewer and less fit individuals, these smaller populations have less resilience and ability to withstand natural fluctuating conditions and human pressures in the marine environment. Smolt size (influenced by the quality of freshwater habitat conditions) has been directly correlated with an individual's likelihood of surviving the marine environment (Bond 2006). For example, a year or two of poor marine survival has different implications for the population in a watershed that produced 200 smolts (Population A) versus one producing 20,000 smolts (Population B). If marine conditions are poor and marine survival is less than one percent, Population A is far more likely to become extirpated than Population B. Salmonids have very high reproductive capacities. For example, an adult female salmon (depending on size and species) can carry between 1,000 and 10,000 eggs; thus, enough individuals of Population B would persist to return to their natal stream and, assuming high quality stream conditions, can rapidly repopulate back to high densities.

Land Uses & the Long-Term Survival of Salmon and Steelhead

Forestlands in California overlay many watersheds where salmonids spawn and rear; thus, the long term maintenance of forested watersheds and protection of watershed processes are highly relevant to the long term survival of salmonids. In fact, non-federal forestlands within the CCC coho salmon ESU are supporting approximately 85 to 90 percent of the last remaining populations. Preventing this species extinction is paramount and their future will depend on whether forest management is practiced that avoids harm and take and is conducted in a manner that is over the long-term compatible with salmonid needs.

While forestlands are critically important to maintain, we acknowledge that species protection in California is not shared equally among adjoining landowners with different forest types in the same watershed (Giusti and Merenlender 2002). A continuum of other land-use activities (e.g., grazing, agriculture, urbanization, sand and gravel mining, mineral mining, hydroelectric dams, summer recreational dams, irrigation impoundments and withdrawals), with little to no oversight body as the BOF and that singly and cumulatively affect salmonids and their habitats, all occur within one watershed across migratory pathways and rearing areas. NMFS staff are working in these other arenas, in addition to forestry, to facilitate appropriate protection for salmonids across all landscapes and marine environments.

For the Central Valley salmonids, 95 percent of their habitats are no longer accessible due to impassible dams. Restoring access above these dams (especially Shasta, Nimbus and Folsom) has been identified as the highest priority for the recovery of these species under recovery planning and the recently released Biological Opinion for the Central Valley Project and the State Water Project. The recently released NMFS Biological Opinion associated with the Operations, Criteria and Plan for the Central Valley Project (OCAP) advises to the Bureau of Reclamation and the Department of Water Resources that to ensure avoidance of jeopardy of Central Valley salmonids that fish passage be provided above Shasta, Folsom and Nimbus dams (for more information on the OCAP Biological Opinion, please see <http://swr.nmfs.noaa.gov/>). Large tracts of federal and non-federal

forestlands occur above these dams and NMFS recommends the BOF anticipate these areas will likely be occupied salmonid habitats in the near future and appropriate protections should be adopted.

Federal Endangered Species Act

Purpose of the ESA

The purposes of the ESA are "to provide a means whereby the ecosystems upon which endangered and threatened species depend may be conserved, and to provide a program for the conservation of such endangered and threatened species" [16 U.S.C. § 1531 (b)]. The ESA defines "conservation," as:

[T]he use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to [the ESA] are no longer necessary. Such methods and procedures include, but are not limited to, all activities associated with scientific resources management such as research, census, law enforcement, habitat acquisition and maintenance, propagation, live trapping, and transplantation.

Under the declared policies of Congress all Federal agencies shall: 1) seek to conserve threatened and endangered species and utilize their authorities in furtherance of the ESA, and 2) cooperate with State and local agencies to resolve water resource issues in concert with conservation of endangered species [16 U.S.C. § 1531 (c)].

Taking or Harming Anadromous Salmonids

Section 9 and regulations promulgated under section 4(d) of the ESA prohibit the "take" of Federally- listed species without a specific permit or exemption by any person subject to the jurisdiction of the United States.

"Take" is broadly defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in any such conduct. A final rule defining the term "harm" was issued by NOAA Fisheries on November 8, 1999 (64 FRN 60727). The "harm" rule provides notification to the public that habitat modification or degradation may harm listed species and, therefore, constitute a "take" under the ESA. "Harm" is defined in 50 C.F.R. § 222.102 as:

"[a]n act which actually kills or injures fish and wildlife. Such an act may include significant habitat modification or degradation which actually kills or injures fish or wildlife by significantly impairing essential behavioral patterns including breeding, spawning, rearing, migrating, feeding or sheltering."

"Person" is defined under the ESA section 3 as "an individual, corporation, partnership, trust, association, or any other private entity; or any officer, employee, agent, department, or instrumentality of the Federal Government, of any State, municipality, or political subdivision of a State, or of any foreign government; any State, municipality, or political subdivision of a State; or any other entity subject to the jurisdiction of the United States." A wide variety of entities are subject to its take prohibitions and many cases have held that States and local municipalities are liable for take [*Loggerhead Turtle v. County Council of Volusia County, Fla.*, 896 F. Supp. 1170,

(1182 M.D. Fla., 1995); Strahan v. Coxe, 127 F.3d 155, 158. (1st Cir., 1997); Palila v. Hawaii Dept. of Land & Natural Resources, 852 F.2d 1106, 1110 (9th Cir.1988); and Defenders of Wildlife v. EPA, 882 F.2d 1294, 1301 (8th Cir.1989)].

Federal Listing Process and Forest Practices Review

Section 4(b)(1)(A) of the Federal ESA and NMFS' implementing regulations (50 CRF part 424) set forth procedures for listing species that requires an assessment of extinction risk with determinations made solely on the basis of best scientific and commercial data, an analysis of the factors affecting the species decline, and an assessment of Federal and non-Federal efforts being made to ameliorate risks and protect the species. In judging the efficacy of existing protective efforts, NMFS relies on the joint NMFS-FWS "*Policy for Evaluation of Conservation Efforts When Making Listing Decisions*" (68 FR 15100; March 28, 2003).

The FRNs for California's listed salmonids contain substantive discussion on extinction risk and conservation efforts associated with the California FPRs and the ongoing dialog between NMFS and the State regarding FPR implementation and effectiveness. The official review of the FPRs during the listing processes for salmonids concluded (in all cases) that they do not adequately protect anadromous salmonids or provide for properly functioning habitat conditions (61 FR 56141; 61 FR 56140; 62 FR 24593; 63 FR 13347; 65 FR 6960; 65 FR 36074). Each FRN includes a "*Summary of Factors Affecting Species*" and a discussion of "*Protective Efforts*". California's non-Federal forestry practices have been identified in these sections as significant factors contributing to salmon and steelhead population declines and the degradation, simplification and fragmentation of their habitats through the present or threatened destruction, modification or curtailment of habitat and range, and the inadequacy of existing regulatory mechanisms (61 FR 56141; 61 FR 56140; 62 FR 24593; 63 FR 13347; 65 FR 6960; 65 FR 36074).

Relevant excerpts from the FR notices include:

62 FR 24593

"Forestry has degraded habitat through the removal and disturbance of natural vegetation, disturbance and compaction of soils, construction of roads and installation of culverts".

"The most pervasive cumulative effect of past forest practices on habitat for salmonids has been an overall reduction in habitat complexity (Bisson et al. 1992), from loss of multiple habitat components. Habitat complexity has declined principally because of reduced size and frequency of pools due to filling with sediment and loss of LWD (Reeves et al., 1993; Ralph et al., 1994). There has been a significant loss of off-channel rearing habitats."

61 FR 56141

"Timber harvest has also been found to alter streambank and channel morphology, alter ambient stream water temperatures, eliminate spawning and rearing habitat, fragment available habitats, eliminate downstream recruitment of spawning gravels and LWD and degrade water quality. Of particular concern is the increased

sediment input into spawning and rearing areas that results from the loss of channel complexity, pool habitat, suitable gravel substrate, and LWD."

61 FR 56140

"...present-day logging practices have improved over those of the past; however, timber harvest is still a major land use in the CCC ESU and fish habitat is still recovering from past logging practices. In addition, the incremental impacts of present-day land management practices and other risk factors, continue to pose a serious threat to CCC coho. NOAA Fisheries believes that the current regulations are a qualitative improvement over historical practices; unfortunately, their effectiveness in protecting watershed processes has never been established (Dunne et al. 2001). There is no substantial body of evidence to demonstrate that the level of protection is sufficient to conserve the anadromous fish habitat and ecosystem upon which salmon and steelhead depend (61 FR 56140)."

NMFS considers the protection and restoration of freshwater spawning, rearing and migratory habitats on non-Federal lands essential for the long-term survival and recovery of anadromous salmonids because non-Federal lands represent such a large portion of the available habitat (63 FR 13347; 65 FR 6960; 65 FR 36074).

A myriad of forestland management operations have been identified as habitat-modifying activities that "harm" and significantly impair essential behavioral patterns of anadromous salmonids [e.g., conducting timber operations in riparian zones and areas susceptible to mass-wasting or surface erosion; and constructing, maintaining, or using inadequate bridges, roads, or trails on stream banks or unstable hillslopes adjacent to, or upstream of, a listed species' habitat] (61 FRN 56147, 61 FRN 24592 and 64 FRN 60727). Entities that approve or conduct forestland operations that result in death or injury to anadromous salmonids are in violation of the Federal ESA and thus liable for ESA take violations through Federal enforcement actions. Through the Federal listing process and in subsequent timber harvest plan reviews between 1999 and 2008, NMFS has determined non-Federal forestry practices do not adequately protect salmonids. In fact, timber harvest and conversion authorized under the FPRs was determined to result in harm and take of federally listed steelhead in an investigation between 1999 and by NOAA Office for Law Enforcement (Attachment 1).

While the ESA identifies those habitat-modifying actions that have adverse effects on salmonids and their habitat, it also facilitates approval of certain activities that, while resulting in some incidental "take", ultimately minimizes or prevents further harm and thus can be authorized [e.g., ESA section 10 (a)(1)(B) Habitat Conservation Plans (HCP)].

Absent an ESA section 10(a)(1)(B) incidental take permit, the legal standard for non-Federal timber harvest operations in California is "no take". Approval of a timber harvest plan (THP) by CalFire does not give a private timber landowner coverage for incidental "take" for Federally-listed salmonids.

Threatened and Impaired Rules

The FRN and final listing of the NC steelhead DPS as a federally threatened (65 FR 36074) species was largely due to the BOF approving only a portion of the 1999 T/I rule package and not fully

implementing critically important conservation measures (e.g., Class II and III protections) to reduce threats from timber harvest activities as the State committed to do in a 1998 NMFS/California Memorandum of Agreement (MOA). This FRN explicitly outlines the lengthy process in 1998 and 1999 that led to the current T/I Rules: (1) development of a science panel to review adequacy of the FPRs; (2) coordination and participation of many agencies, stakeholders and public representatives in the development of a proposed Rule package; (3) special authorization provide to the BOF by the legislature to adopt new rules specifically for salmonids during the year 2000; and (4) the final vote of the BOF to adopt only a subset of the Rules and apply a sunset clause to these rules. Because the BOF did not adopt the full package as was anticipated under the MOA, NMFS reconsidered the status of, and protective measures for, the NC steelhead DPS. NMFS testimony to the BOF in 2000 and the June 7, 2000 FRN outlined that the T/I Rules “*constitute a good first step in addressing many concerns raised during the FPR review process; however, they collectively fail and are currently inadequate to protect anadromous salmonids, including steelhead, and their habitat.*”

A summary of the issues outlined in the administrative record for the T/I Rules that continue as important considerations for the current Rule Notice and the protection of anadromous salmonids are:

NC Steelhead FRN June 7 2000 65 FR36074

Specific Inadequacies of Forestry Rules [36085]

1. *Protective provisions that are not supported by scientific literature;*
2. *Provisions that are scientifically inadequate to protect salmonids;*
3. *Inadequate and ineffective cumulative effect analyses;*
4. *Dependence upon RPFs that may not possess the necessary level of multidisciplinary technical expertise to develop THPs protective of salmonids;*
5. *Dependence by CDF on other State agencies to review and comment on THPs;*
6. *Failure by CDF to incorporate recommendations from other agencies; and*
7. *Inadequate enforcement due to staff limitations.*

NC Steelhead FRN June 7 2000 65 FR36074

What Interim Rules Changes (T/I) do not address [36085]

1. *Site specific variation and long-term riparian functions;*
2. *Non-fishbearing perennial/ephemeral streams that carry water during winter;*
3. *Rate of timber harvest in a watershed;*
4. *All other winter operations and wet weather road and skid trail planning;*
5. *Road planning, construction, maintenance and decommissioning;*
6. *Loss of riparian function and chronic sediment inputs from streamside roads;*
7. *Unstable areas except for inner gorges;*
8. *Timber harvest preparation, review, implementation, enforcement and validity;*
9. *Harvest plan exemptions; and*
10. *Watershed analysis, cumulative effects, adaptive management and monitoring.*

Until a comprehensive scientific peer review process is implemented and appropriate changes to FPR/THP approval process are made, properly functioning conditions for salmonids would not exist on non-Federal forest lands in California.

The administrative record preceding, and since, the adoption of the T/I Rules, as well as the Federal Register Notice published June 7, 2000 (65 FR 36074), provides substantive information regarding NMFS findings on the adequacy of the T/I Rules, and other pertinent processes governed by the Board of Forestry, in protecting federally listed salmonids. Few change to the T/I Rules have occurred since their adoption; however, coho salmon and Chinook populations are more imperiled and adoption of protective FPRs more essential.

Standard for Performance of Revised T/I Rules

It is the articulated intent of the BOF to adopt rules protective of salmonids (Notice of Proposed Rulemaking, Watersheds with Threatened or Impaired Values, May 8, 2009; Initial Statement of Reasons, Watersheds with Threatened or Impaired Values, May 8, 2009). Since 1999 NMFS has recommended the BOF develop either no-take rules (*e.g.*, similar to those for the federally listed northern spotted owl and marbled murrelet) or move forward on the development of an ESA section 10(a)(1)(B) statewide permit (*e.g.*, HCP) that authorizes incidental take of listed salmonids as exemplified by the State of Washington and encouraged by the Undersecretary of Commerce in a letter to the California Secretary of Resources, Mr. Chrisman in 2006 (Attachment 2). The development of no-take rules or an HCP would ensure that the BOF, CalFire, the plan submitter and all California forestry landowners are protected from enforcement actions and/or discretionary reviews of harvest plans by NMFS staff due to concerns of possible death or harm (*e.g.*, unauthorized take) of salmonids due to timber harvest activities.

NMFS Findings & Recommendations

NMFS has considered all relevant factors in consideration of the noticed Rule Package: (1) current status of salmonids, (2) the complexities of watershed processes and the importance of forestlands that provide for salmonid habitats and (3) the administrative record and legal framework of the ESA.

In consideration of these factors NMFS has made the following findings:

1. Of those factors found inadequate in the final listing of the NC steelhead DPS (65 FR36074), the current Rule Notice addresses those issues associated with site specific variations and non-fishbearing perennial streams and ephemeral streams.
2. The addition of a no cut zone along Class I's and explicit protective measures for floodplains, Class IIs and Class IIIs are critically important and are a substantial improvement over the current T/I Rules.
3. While the Rule Notice is, in large part, based on scientific principles and includes protection measures for Class II and III watercourses, it does not meet a no-take standard.
4. Should the BOF adopt the most protective options and approve them as final rules, the new set of Rules would be a step forward and provide a foundation for development of a State Forestry HCP.

NMFS recommends the following for the protection of federally listed salmonids and their habitats on forested lands:

1. Retain all current T/I Rules not included or addressed in the Rule Notice (e.g., inner gorge protections).
2. Formalize a process to resolve all outstanding T/I topics outlined in the Initial Statement of Reasons, May 8, 2009, not included in current T/I rules or the Rule Notice and those outstanding from the NC steelhead DPS FRN (65 FR 36085). These include: (1) monitoring and adaptive management; (2) cumulative impact assessment; (3) tractor road crossings and logging road requirements; (4) 303(d) listed water body requirements; (5) long term riparian function; (6) rate of timber harvest in a watershed; (7) winter operations and wet weather road and skid trail planning; (8) unstable areas [including inner gorges]; (9) timber harvest plan preparation, review, implementation, enforcement and technical validity; (10) harvest plan exemptions and (11) watershed analysis. It was determined by NMFS in 2000 that until a comprehensive scientific peer review process was developed and implemented as part of the BOF rule making process that properly functioning conditions would not likely exist on non-Federal forestlands in California. While a Scientific Review Panel was formulated to review and provide a summary of scientific literature supporting the Rule Notice, the panel has not been consulted regarding the efficacy of the current Rule Notice (and the associated proposed practices and protections) to provide for salmonids and their habitats.
3. The BOF adopt nearly all BOF staff recommendations to include:
 - a. Geographic scope;
 - b. All measures for Class I and II core zones, inner zones and outer zones;
 - c. Optional amendment #8 (all references), 17, 19, 20, 21, 22, 23, 33; and
 - d. All Class III BOF staff recommendations.
4. NMFS recommends deleting "primary limiting factors" and clarifying the goals in section 916.9(a) to comport with other BOF articulated goals outlined in the Initial Statement of Reasons (e.g., protection of salmonids in forested lands, protection and restoration of habitat conditions, increasing fish abundance and improvement status of threatened salmonids). Goals should outline protection of watershed conditions and processes that highly support essential behavioral patterns of spawning, rearing, migrating and feeding for salmonid short and long term survival. References to "significant adverse impacts" and "primary limiting factors" are unsubstantiated and ambiguous. These definitions could potentially limit or broaden the intended scope and are not directly relevant to the BOF articulated goals nor the concepts critical to prevent extinction and ensure salmonid survival and ultimate recovery.
5. Adoption of any combination of one or more of the following optional amendments would not provide sufficient protection of salmonids and their habitats and may, in combination with other activities, increase the likelihood and risk of "harm", "take" or extinction (Optional Amendments: 1, 2, 3, 4, 5, 6, 7, 9, 12, 13, 15, 16, 18, 25, 26, 27, 28, 30, 31 and 32).
6. Include forestlands above Shasta/Keswick, Folsom/Nimbus dams within the appropriate Anadromy Zone in anticipation of these areas becoming accessible and occupied by salmonids in the near future (NMFS OCAP Biological Opinion 2009). See Attachment 3 as a reference to the geographic locations.

7. NMFS recommends greater protections in floodplain areas. These habitats have been determined as part of recovery planning to be critically important to coho salmon overwinter survival. Retain the current definition of Channel Zone or add to the proposed Water Transition Line definition (b) "for a watercourse where there is a CMZ or floodprone zone the line is defined by the outside edge of the zone". The outlined Best Management Practices for floodprone areas should be enforceable and be redeveloped as standard prescriptions.

8. NMFS agrees with, and is supportive of, many CalFire and California Department of Fish and Game (CDFG) recommendations to the BOF in their June 18, 2009 joint letter. However, NMFS does not support the spatially explicit alternatives (including the site specific plans for unconfined watercourses with floodprone areas) and the alternative measures outlined for the Southern Subdistrict of the Coast Forest District at this time.
 - a. NMFS supports the concept of using watershed data for site specific timber management planning (as detailed by Dr. Sullivan of Humboldt Redwoods Company on June 3, 2009) and encourages the BOF to develop a formal process that takes into account the authorities of the ESA to work towards that goal. However, the ability of Humboldt Redwoods Company to conduct timber management in a spatially explicit and site specific manner is the advantage of (1) applying for incidental take authorization from NMFS and developing an HCP, (2) investing in (and conducting) extensive instream and upslope monitoring and (3) working closely with CDFG and NMFS to correlate monitoring data with proposed adaptations to forest management. Thus, NMFS strongly recommends the BOF not adopt the spatially explicit alternative at this time. Site specific planning in light of significant species' declines and California's data deficient environment would not be sufficiently precautionary and places the BOF, CalFire, landowners and foresters at high risk of potentially proposing and approving of activities that may likely result in unauthorized harm or take of salmonids. It is recommended that the BOF work through the appropriate Federal processes to allow for such spatially explicit planning.

 - b. Alternative protections for the Southern Subdistrict of the Coast Forest District are not supported. We acknowledge that county rules for San Mateo and Santa Cruz provide additional protections to critical watershed processes over and above current FPRs and those proposed in the Rule Notice. Nonetheless, these counties maintain the southern most populations of CCC coho salmon; the most imperiled species in California at this time. Recent CCC coho salmon surveys by NOAA Southwest Fisheries Science Center south of the San Francisco Bay indicate that populations are exceptionally reduced from historical numbers and are geographically isolated. Water temperatures are susceptible to warming through canopy reductions and CCC coho salmon are highly vulnerable and sensitive to increasing stream temperatures. While populations at the extreme edge of their range are more susceptible to extinction, these populations also support a unique genetic diversity that can often allow a population or species to quickly adapt to shifting and unstable environments. It is therefore, our recommendation that the standard Coastal Anadromy Rules apply to the Southern Subdistrict until such time sufficient, robust and scientifically peer reviewed data become available to suggest alternative prescriptions are appropriate.

NMFS will continue to support and acknowledge the importance of forestlands and their role in protecting and ensuring the long term survival of California's salmonids. We believe critical elements of the proposed Rule Notice include appropriate, relevant and scientifically based measures that, if adopted by the BOF, would provide increased assurances that salmonids and their habitats are protected. We will continue to work with the BOF; California's forestlands are inextricably linked to the future of many California's iconic salmon and steelhead.

Thank you and if you have any questions or would like to meet with staff regarding comments in this letter please contact Charlotte Ambrose at (707) 575-6068.

Sincerely,

Rodney McInnis
Regional Administrator

NEWS FROM NOAA

NATIONAL OCEANIC & ATMOSPHERIC ADMINISTRATION • US DEPARTMENT OF COMMERCE

Contact: Jim Milbury – 562.980.4006

FOR IMMEDIATE RELEASE
January 3, 2007

Forestry landowner violates Federal Endangered Species Act and is fined by NOAA Fisheries Service for harming and killing federally protected steelhead trout while operating under a State of California approved timber plan.

LAYTONVILLE, Calif. — A forest landowner in Mendocino County was recently assessed a fine of \$105,600 dollars by NOAA's National Marine Fisheries Service (NOAA Fisheries Service) for harming and killing federally protected steelhead trout, despite being in compliance with state regulations.

The landowner was converting 130 acres of timberland into vineyards in accordance with California's Forest Practice Rules under a 1999 Timber Harvest Plan (THP) and Timber Conversion Permit approved by the California Department of Forestry (CDF).

The land conversion involved cutting trees and permanently removing mature redwood and Douglas fir forest stands, mechanically removing tree roots, soil ripping, road and drainage construction and extensive land grading. These activities resulted in widespread erosion on the property that deposited significant volumes of hillside soil into nearby steelhead trout streams, killing the steelhead trout in violation of federal law.

In this location the impacted steelhead trout are part of the Northern California Distinct Population Segment living in coastal rivers from Redwood Creek in Humboldt County south to, but not including, the Russian River. NOAA Fisheries Service listed this steelhead trout population as threatened under the Federal Endangered Species Act (ESA) (e.g., likely to become endangered within the foreseeable future) in June of 2000. A key factor in the federal listing was that critically important revisions to California's Forest Practice Rules to better protect steelhead and salmon were not implemented by the governor-appointed Board of Forestry as agreed upon in a 1998 State of California/NOAA Memorandum of Agreement. See Federal Register Notice June 7, 2000 65 FR 36074.

To date, full revisions to the forestry rules have yet to be realized. However, NOAA and the State agencies of the Department of Forestry and Department of Fish and Game continue to work with the Board of Forestry to explore ways to ensure that implementation of California's Forest Practice Rules will sufficiently protect salmon and steelhead species listed under the federal ESA, and not put citizens in danger of violating federal law even if they are meeting state requirements.

In prosecuting this case, NOAA Fisheries Service and Office for Law Enforcement, were notified in 2002 by the California North Coast Regional Water Quality Control Board (RWQCB) that large volumes of soil were depositing into several streams in northwestern Mendocino County, violating water quality standards and likely harming steelhead trout.

-more-

Subsequent investigations by NOAA Fisheries Service law enforcement agents and scientists revealed that hillside soil was being washed into steelhead trout streams in such large volumes that young steelhead trout were being harmed and killed. Absent incidental take authorization, the killing or harming of a federally listed salmon or steelhead is unlawful. The landowner, Stuart Bewley of Alder Springs Ranch, was assessed \$105,600 for eight violations of the ESA.

This initial assessment was reduced to \$10,000 in consideration of the landowners' cooperation and his \$870,000 investment to address erosion problems on the property. A settlement agreement was reached, including an admission of guilt in violating the ESA, with the final penalty to the landowner reduced to a civil crime and a fine of \$10,000.

Steelhead are a form of rainbow trout that migrate between fresh and saltwater during different phases of their life-cycle. During winter months, when rain events create flow conditions suitable for upstream migration, adult steelhead move from the ocean into freshwater rivers and streams to spawn. The offspring remain in the stream for two to three years before moving downstream and into the ocean. While growing in the local streams, steelhead young are susceptible to water quality and other habitat changes that affect their ability to forage, rest, and avoid predators. Harmful water quality changes include, among other things, reduced flow, increased water temperatures, and inputs of toxins including soil. Other habitat changes include construction of barriers which inhibit free movement along the stream corridor as stream conditions change.

Steelhead remain in the ocean for several years before returning to their natal stream to spawn. Unlike salmon, steelhead do not necessarily die after spawning, and may return to the ocean, and live to spawn again. Some steelhead may return to the same stream to spawn three or four times over their life span.

The National Oceanic and Atmospheric Administration, an agency of the U.S. Commerce Department, is celebrating 200 years of science and service to the nation. From the establishment of the Survey of the Coast in 1807 by Thomas Jefferson to the formation of the Weather Bureau and the Bureau of Commercial Fisheries in the 1870s, much of America's scientific heritage is rooted in NOAA.

NOAA is dedicated to enhancing economic security and national safety through the prediction and research of weather and climate-related events and information service delivery for transportation, and by providing environmental stewardship of our nation's coastal and marine resources. Through the emerging Global Earth Observation System of Systems (GEOSS), NOAA is working with its federal partners, more than 60 countries and the European Commission to develop a global monitoring network that is as integrated as the planet it observes, predicts and protects.

UNITED STATES DEPARTMENT OF COMMERCE
The Under Secretary of Commerce
for Oceans and Atmosphere
Washington, D.C. 20230

OCT 17 2006

Mr. Mike Chrisman
Secretary for Resources
State of California Resources Agency
1416 Ninth Street
Sacramento, California 95814

Dear Mr. Chrisman:

I enjoyed having lunch with you on September 19 while I was in California. During lunch you mentioned California's pursuit of a salmon and steelhead Habitat Conservation Plan (HCP) and incidental take permit for the State-regulated forestry activities on private land. The National Oceanic and Atmospheric Administration's (NOAA) National Marine Fisheries Service (NMFS) has been involved in forestry discussions and field reviews since 1997 to encourage meaningful modifications to State Forest Practice Rules. While NMFS has not received an application from the State, NMFS has been fully engaged in the preliminary discussions and is prepared to provide additional staff resources to be responsive to the State's needs. Timely completion of a state-wide forestry HCP aligning salmon and steelhead conservation with sustained forestland management is a goal we share with California.

This process is applicant-driven and development of a sound HCP will depend upon a strong working partnership between NMFS, State of California natural resources agencies, the California Board of Forestry, the U.S. Fish and Wildlife Service, and the public. Often, HCP development can be a protracted process; however, a collaborative and structured approach will accelerate the completion schedule. An important first step is for the State to work closely with NMFS to submit a comprehensive application package. Central to the HCP package is the State's need to review NMFS' forestry administrative record and to modify California Forest Practice Rules, where needed, while ensuring Rule implementation, enforcement, and monitoring aligns with HCP requirements.

NMFS fully supports the HCP effort and looks forward to working with the State of California on this important endeavor.

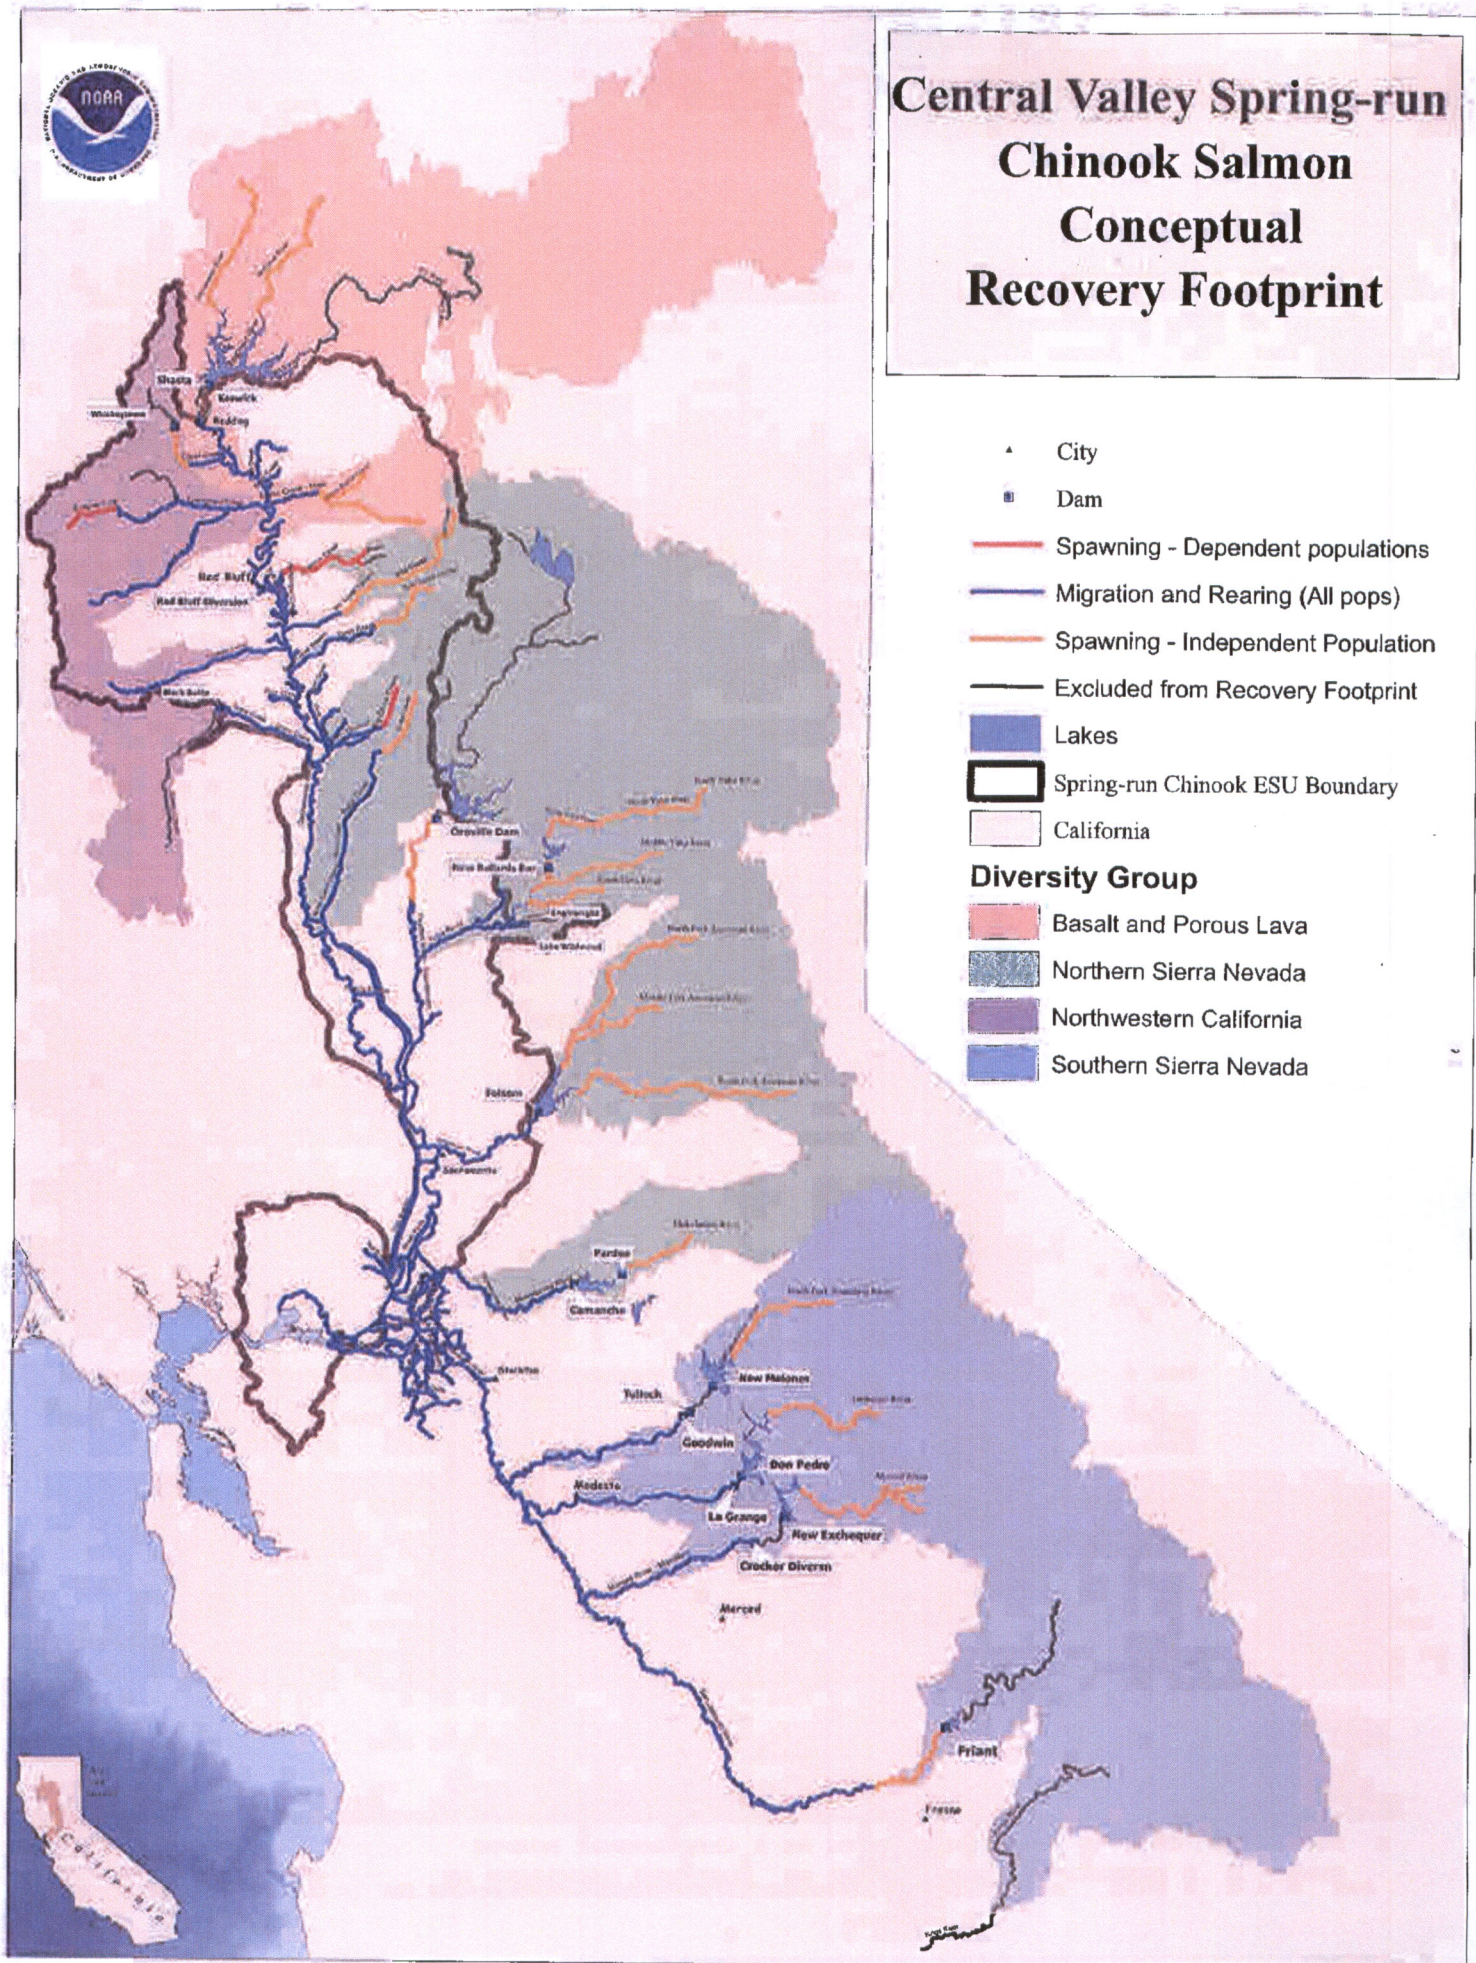

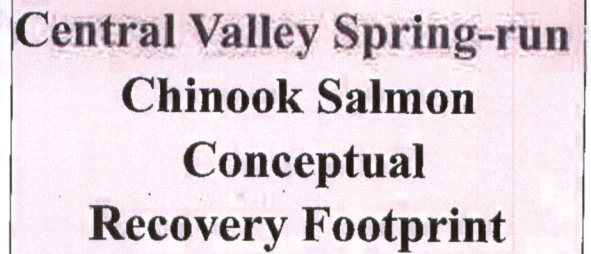

Sincerely,

Conrad C. Lautenbacher, Jr.
Vice Admiral, U.S. Navy (Ret.)
Under Secretary of Commerce for
Oceans and Atmosphere

THE ADMINISTRATOR

Endangered and Threatened Species: Threatened Status for One Steelhead Evolutionarily Significant Unit (ESU) in California

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Final rule.

SUMMARY: Following completion of a comprehensive status review of west coast steelhead (*Oncorhynchus mykiss*, or *O. mykiss*) populations throughout Washington, Oregon, Idaho, and California, NMFS published a proposed rule to list 10 ESUs as threatened or endangered under the Endangered Species Act (ESA) on August 9, 1996. One of these steelhead ESUs, the Northern California ESU, was proposed for listing as a threatened species. Because of scientific disagreements, NMFS deferred its final listing

determination for five of these steelhead ESUs, including the Northern California ESU, on August 18, 1997. After soliciting and reviewing additional information to resolve these disagreements, NMFS published a final determination in March 1998 that the Northern California ESU did not warrant listing under the ESA because available scientific information and conservation measures indicated the ESU was at a lower risk of extinction than at the time of the proposed rule. Because the State of California did not implement conservation measures that NMFS considered critically important in its decision to not list the Northern California steelhead ESU, NMFS completed an updated status review for the ESU and reassessed the State and Federal conservation measures that were in place to protect the ESU. Based on this reconsideration, NMFS proposed to list the Northern California steelhead ESU as a threatened species under the ESA on February 11, 2000.

After considering public comments on the proposed determination, NMFS now issues a final rule to list the Northern California ESU of steelhead as a threatened species. Within the Northern California ESU, only naturally spawned populations of steelhead (and their progeny) residing below naturally occurring and man-made impassable barriers (e.g., impassable waterfalls and dams) are listed. NMFS has examined the relationship between hatchery and natural populations of steelhead in this ESU and concludes hatchery populations are not essential for recovery; therefore, no hatchery populations are listed. At this time, NMFS is listing only the anadromous life forms of *O. mykiss* in this ESU. NMFS intends to designate critical habitat and promulgate protective regulations under section 4(d) of the ESA for this ESU in separate rulemakings.

DATES: Effective August 7, 2000.

ADDRESSES: Assistant Regional Administrator, Protected Resources Division, NMFS, Southwest Region, 401 West Ocean Blvd., Suite 4200, Long Beach, CA 90802 4213.

SUPPLEMENTARY INFORMATION:

Previous Federal ESA Actions Related to West Coast Steelhead

The history of petitions NMFS has received regarding west coast steelhead is summarized in a final rule and notice of determination for five steelhead ESUs (Lower Columbia River; Central Valley,

California; Oregon Coast; Klamath Mountains Province; and northern California ESUs) that was published on March 19, 1998 (63 FR 13347). The most comprehensive petition was submitted by Oregon Natural Resources Council and 15 co-petitioners on February 16, 1994. In response to this petition, NMFS assessed the best available scientific and commercial data, including technical information from Pacific Salmon Biological Technical Committees (PSBTCs) and interested parties in Washington, Oregon, Idaho, and California, and convened a Biological Review Team (BRT), composed of staff from NMFS' Northwest and Southwest Fisheries Science Centers and Southwest Regional Office, as well as a representative of the U.S. Geological Survey Biological Resources Division (formerly the National Biological Service) to conduct a coast-wide status review for west coast steelhead (Busby *et al.*, 1996).

Based on the results of the BRT's status review, an analysis of Federal, State and local conservation measures, and other information which NMFS determined constituted the best scientific and commercial data available, NMFS published a proposed listing determination (61 FR 41541, August 9, 1996) that identified 15 ESUs of steelhead in the states of Washington, Oregon, Idaho, and California. Ten of these ESUs, including the northern California ESU, were proposed for listing as threatened or endangered species, four were found not warranted for listing, and one was identified as a candidate for listing.

On August 18, 1997, NMFS published a final rule listing five ESUs as threatened and endangered under the ESA (62 FR 43937). In a separate notice published on the same day, NMFS determined substantial scientific disagreement remained for five proposed ESUs, including the northern California steelhead ESU (62 FR 43974, August 18, 1997). In accordance with section 4(b)(6)(B)(i) of the ESA, NMFS deferred its decision on these five steelhead ESUs for 6 months for the purpose of soliciting additional data. During this 6-month period of deferral, NMFS received new scientific information regarding the status of these proposed steelhead ESUs. This new information was evaluated by NMFS' BRT which prepared both an updated status review for these five ESUs (Memorandum to William Stelle and William Hogarth from M. Schiewe, December 18, 1997, Status of Deferred and Candidate ESUs of West Coast Steelhead (NMFS, 1997a)), and a review of the associated hatchery populations

(Memorandum to William Stelle and William Hogarth from Michael Schiewe, January 13, 1998, Status Review Update for Deferred ESUs of West Coast Steelhead: Hatchery Populations (NMFS, 1998a)).

Based on a review of the updated scientific information for these ESUs, as well as a review and evaluation of Federal, state, and local conservation measures reducing the threats to these ESUs, NMFS issued a final rule (63 FR 13347, March 19, 1998) listing two ESUs as threatened (Lower Columbia River and Central Valley California), and a notice of determination that three ESUs (Oregon Coast, Klamath Mountains Province, and Northern California) did not warrant listing. NMFS' determination that these three ESUs did not warrant listing was based on the best available scientific and commercial data which indicated these ESUs were at a lower risk of extinction than at the time of the proposed listing determination. Even though the risks confronting these ESUs had been reduced to a point at which listing was not warranted, NMFS still expressed concerns about the status of these three ESUs in the notice of determination, and, therefore, identified them as candidate species which the agency would continue to monitor.

NMFS's March 19, 1998 (63 FR 13347), decision not to list the Northern California steelhead ESU was based largely on a determination that sufficient Federal and state conservation measures were in place to reduce threats to the ESU such that the proposed threatened listing was unnecessary. The Federal and state conservation measures upon which NMFS based this determination included: (1) implementation of a March 11, 1998, Memorandum of Agreement (MOA) between NMFS and the State of California (NMFS/California MOA, 1998), with particular importance given to implementation of those provisions in the MOA which were intended to improve non-Federal forest land protections in the ESU (81 percent of land ownership is non-Federal land); (2) implementation of more restrictive in-river harvest regulations by California which were intended to reduce mortality and increase the viability of naturally reproducing steelhead populations; and (3) improved protections to habitat and naturally reproducing steelhead from expanded habitat protection and restoration efforts, improvements in the management of hatchery steelhead stocks, and expanded population monitoring.

At the time of its decision not to list the Northern California ESU, NMFS considered the protection and restoration of freshwater spawning, rearing, and migratory habitat on non-Federal lands to be essential for the long-term survival and recovery of this ESU because non-Federal lands represented such a large portion of the available habitat (63 FR 13347, March 19, 1998). Because of NMFS' concerns regarding the preponderance of private timber lands and timber harvest in the northern California ESU, the NMFS/California MOA contained several provisions calling for the review and revision of California's forest practice rules (FPRs), and a review of their implementation and enforcement by January 1, 2000. NMFS considered full implementation of these critical provisions within the specified time frame to be essential for achieving properly functioning habitat conditions for steelhead in this ESU.

In accordance with the NMFS/California MOA, a scientific review panel was established by the State to review the California FPRs, including their implementation and enforcement. The scientific review panel completed its review and provided the State's Board of Forestry (BOF) with its findings and recommendations in June 1999. In its findings, the review panel concluded that California's FPRs, including their implementation through the existing timber harvest plan process, do not ensure protection of anadromous salmonid habitat and populations. To address these shortcomings, and as specified in the NMFS/California MOA, the California Resources Agency and CalEPA jointly presented the BOF with a proposed rule change package in July 1999. Following several months of public review, the Board of Forestry took no action on the package in October 1999, thereby precluding any possibility of implementing improvements in California's FPRs by January 1, 2000, as the State committed to do in the NMFS/California MOA.

Although NMFS' March 19, 1998, decision not to list the northern California ESU concluded that improvements in steelhead harvest and hatchery management would provide immediate conservation benefits to this ESU, an essential component of the decision was based on NMFS' expectation that changes in the State's FPRs would be implemented by January 1, 2000. Because these critical conservation measures were not being implemented by the State of California, and therefore, were not reducing threats to this ESU that were anticipated at the time of its March 19, 1998, decision not

to list the ESU, NMFS determined that a formal reconsideration of the status of this ESU was warranted (December 3, 1999, Memorandum from Rodney R. McInnis and William Stelle, Jr. to Penelope D. Dalton (NMFS, 1999)).

As part of this reconsideration, the Southwest Fisheries Science Center (SWFSC) completed an updated status review for the Northern California steelhead ESU in January, 2000 which concluded that its biological status had changed little since NMFS' steelhead BRT determined in December 1997 that the ESU was likely to become endangered in the foreseeable future. NMFS also conducted a re-evaluation of Federal and state conservation measures that were in place to protect this ESU, including the implementation and success of measures such as the NMFS/California MOA that were considered important factors in the original decision not to list the ESU. Based on the updated status review and re-assessment of conservation measures, NMFS concluded that the Northern California steelhead ESU was likely to become endangered in the foreseeable future, and therefore, proposed to list the ESU as a threatened species under the ESA on February 11, 2000 (65 FR 6960).

Steelhead Life History and Background

Biological information for west coast steelhead (*Oncorhynchus mykiss*) and the northern California ESU in particular can be found in steelhead status assessments conducted by NMFS (Busby *et al.*, 1996; NMFS, 1997a; NMFS, 2000) and in previous **Federal Register** documents (61 FR 41541, August 9, 1996; 63 FR 13347, March 19, 1998; 65 FR 6960, February 11, 2000). A summary of steelhead life history follows.

O. mykiss exhibits one of the most complex suites of life history traits of any salmonid species. Individuals may exhibit anadromy (meaning they migrate as juveniles from fresh water to the ocean, and then return to spawn in fresh water) or freshwater residency (meaning they reside their entire life in fresh water). Resident forms are usually referred to as "rainbow" or "redband" trout, while anadromous life forms are termed "steelhead." Few detailed studies have been conducted regarding the relationship between resident and anadromous *O. mykiss* and as a result, the relationship between these two life forms is poorly understood. The scientific name for the biological species that includes both steelhead and rainbow trout has been changed from *Salmo gairdneri* to *O. mykiss*. This change reflects the premise that all

trout from western North America share a common lineage with Pacific salmon.

Steelhead typically migrate to marine waters after spending 2 years in fresh water. They then reside in marine waters for typically 2 or 3 years prior to returning to their natal stream to spawn as 4- or 5-year-olds. Unlike other Pacific salmon, steelhead are iteroparous, meaning they are capable of spawning more than once before they die. However, it is rare for steelhead to spawn more than twice before dying; most that do so are females. Steelhead adults typically spawn between December and June (Bell, 1990; Busby *et al.*, 1996). Depending on water temperature, steelhead eggs may incubate in "redds" (nesting gravels) for 1.5 to 4 months before hatching as "alevins" (a larval life stage dependent on food stored in a yolk sac). Following yolk sac absorption, young juveniles or "fry" emerge from the gravel and begin actively feeding. Juveniles rear in fresh water from 1 to 4 years, then migrate to the ocean as "smolts."

Biologically, steelhead can be divided into two reproductive ecotypes, based on their state of sexual maturity at the time of river entry and the duration of their spawning migration. These two ecotypes are termed "stream maturing" and "ocean maturing." Stream maturing steelhead enter fresh water in a sexually immature condition and require several months to mature and spawn. Ocean maturing steelhead enter fresh water with well developed gonads and spawn shortly after river entry. These two reproductive ecotypes are more commonly referred to by their season of freshwater entry (i.e., summer [stream maturing] and winter steelhead [ocean maturing]). The Northern California ESU contains populations of both winter and summer steelhead.

Two major genetic groups or "subspecies" of steelhead occur on the west coast of the United States: a coastal group and an inland group, separated in the Fraser and Columbia River Basins approximately by the Cascade crest (Huzyk & Tsuyuki, 1974; Allendorf, 1975; Utter & Allendorf, 1977; Okazaki, 1984; Parkinson, 1984; Schreck *et al.*, 1986; Reisenbichler *et al.*, 1992). Behnke (1992) proposed classifying the coastal subspecies as *O. m. irideus* and the inland subspecies as *O. m. gairdneri*. These genetic groupings apply to both anadromous and nonanadromous forms of *O. mykiss*. Both coastal and inland steelhead occur in Washington and Oregon. California is thought to have only coastal steelhead while Idaho has only inland steelhead. The northern

California steelhead ESU is part of the coastal grouping.

Historically, steelhead were distributed throughout the North Pacific Ocean from the Kamchatka Peninsula in Asia to the northern Baja Peninsula. Presently, the species distribution extends from the Kamchatka Peninsula, east and south along the Pacific coast of North America, to at least Malibu Creek in southern California. There are infrequent anecdotal reports of steelhead occurring as far south as the Santa Margarita River in San Diego County (McEwan & Jackson, 1996). In 1999, juvenile *O. mykiss* suspected of being the progeny of steelhead were reported from San Mateo Creek which is in northernmost San Diego County, just north of the Santa Margarita River. Historically, steelhead likely inhabited most coastal streams in Washington, Oregon, and California as well as many inland streams in these states and Idaho. However, during this century, over 23 indigenous, naturally reproducing stocks of steelhead are believed to have been extirpated, and many more are thought to be in decline in numerous coastal and inland streams in Washington, Oregon, Idaho, and California. Forty-three stocks have been identified by Nehlsen *et al.* (1991) as being at moderate or high risk of extinction.

Summary of Comments Received in Response to the Proposed Rule

Following NMFS proposal to list 10 steelhead ESUs in 1996, including the Northern California ESU (61 FR 41541), a total of 16 public hearings were held in California, Oregon, Idaho, and Washington to solicit comments on the proposed rule. During the 90-day public comment period, NMFS received nearly 1,000 written comments on the proposed rule from Federal, state, and local government agencies, Indian tribes, non-governmental organizations, the scientific community, and other individuals. A number of comments addressed specific technical issues pertaining to a particular geographic region or *O. mykiss* population. These technical comments were considered by NMFS' steelhead BRT in its re-evaluation of ESU definitions and status, including the Northern California steelhead ESU, and were discussed in the updated status review report (NMFS, 1997a).

During the 60-day public comment period that followed publication of the proposal to list this ESU (65 FR 6960), NMFS received numerous written comments and also held one public hearing in Eureka, California to solicit comments on the proposal. A total of 20

individuals presented testimony at this public hearing, with the majority expressing their opposition to the proposed listing. During the 60-day public comment period that followed publication of the proposed rule, NMFS received 44 written comments from Federal, state, and local government agencies, Indian tribes, non-governmental organizations, and other individuals. In contrast to the public hearing, the majority of written comments were supportive of the proposal. A number of comments addressed issues pertaining to the designation of critical habitat which was not proposed at the time of the listing proposal. Several commenters requested NMFS promulgate an ESA 4(d) rule that would allow continued catch and release angling opportunities in coastal streams occurring within the Northern California steelhead ESU. At least one commenter resubmitted comments that had originally been submitted to NMFS when this ESU was first proposed for listing in 1996.

A summary of comments received in response to the proposed rule follows.

Issue 1: Sufficiency and Accuracy of Scientific Information and Analysis

Comment 1: Some commenters questioned the sufficiency and accuracy of data NMFS employed in the listing proposal.

Response: Section 4(b)(1)(A) of the ESA requires that NMFS make its listing determinations solely on the basis of the best available scientific and commercial data, after reviewing the status of the species and taking into account any efforts being made to protect such species. NMFS believes that information contained in the agency's original status review (Busby *et al.*, 1996), together with more recent information (NMFS, 1997a; NMFS, 1998a; NMFS, 2000), represents the best scientific and commercial information presently available for the Northern California steelhead ESU addressed in this final rule. NMFS has made every effort to conduct an exhaustive review of all available information and has solicited information and opinion from all interested parties.

Comment 2: Some comments suggested that the ESA does not provide for the creation of ESUs and that ESUs do not correspond to species, subspecies, or distinct population segments (DPSs) that are specifically identified in the ESA. Further, NMFS' use of genetic information (allozyme- or DNA-derived information) to determine ESU boundaries was criticized. It was argued that allozyme-based electrophoretic data cannot be used to imply either evolutionary significance

or local adaptation. Some commenters felt that information was lacking concerning a number of "key" criteria for defining the Northern California steelhead ESU, such as phenotypic differences, evolutionary significance, or ecological significance of various summer and winter steelhead populations. Commenters contended that NMFS did not find any life history, habitat, or phenotypic characteristics that were unique to any of the steelhead populations discussed.

Response: General issues relating to ESUs, Distinct Population Segments (DPSs), and the ESA have been discussed extensively in past **Federal Register** documents. Regarding application of its ESU policy, NMFS relies on its policy describing how it will apply the ESA definition of "species" to anadromous salmonid species published in 1991 (56 FR 58612, November 20, 1991). More recently, NMFS and the U.S. Fish and Wildlife Service published a joint policy, that is consistent with NMFS' policy, regarding the definition of "distinct population segments" (61 FR 4722, February 7, 1996). The earlier policy is more detailed and applies specifically to Pacific salmonids, and therefore, was used for this determination. This policy indicates that one or more naturally reproducing salmonid populations will be considered to be distinct and, hence, a species under the ESA, if they represent an ESU of the biological species. To be considered an ESU, a population must satisfy two criteria: (1) It must be reproductively isolated from other population units of the same species; and (2) it must represent an important component in the evolutionary legacy of the biological species. The first criterion, reproductive isolation, does not have to be absolute but must have been strong enough to permit evolutionarily important differences to occur in different population units. The second criterion is met if the population contributes substantially to the ecological or genetic diversity of the species as a whole. Guidance on applying this policy is contained in a NOAA Technical Memorandum entitled "Definition of 'Species' Under the Endangered Species Act: Application to Pacific Salmon" (Waples, 1991) and in a more recent scientific paper by Waples (1995).

NMFS identified all west coast steelhead ESUs including the Northern California ESU in the original steelhead status review, using the best available scientific and commercial information. As discussed in the original status review, genetic data were used primarily to evaluate the criterion

regarding reproductive isolation, not evolutionary significance. In some cases, there was a considerable degree of confidence in the ESU determinations. The west coast steelhead status review describes a variety of characteristics that support the ESU delineations for this species, including ecological and life history parameters.

Comment 3: Some commenters suggested that listing of the Klamath Mountains Province (KMP) steelhead ESU was also warranted based on the rationale NMFS provided for its decision to propose listing the Northern California steelhead ESU.

Response: NMFS' decision not to reconsider the KMP steelhead ESU for listing is based on the determination that there are sufficient Federal and state conservation measures in place to reduce the threats to the ESU such that listing is not warranted. The Federal and state conservation measures which NMFS bases this determination on include: (1) the large portion of Federal land ownership in the ESU (64 percent for the entire ESU and 80 percent in the California portion of the ESU) coupled with successful implementation of the Northwest Forest Plan on Federal lands which reduced habitat risks; (2) substantial changes to the management of recreational fisheries and artificial propagation programs by the states of Oregon and California which are reducing impacts to steelhead; and (3) general improvements to habitat conditions throughout the ESU resulting from state-wide conservation strategies and monitoring efforts in both Oregon and California. In California, these efforts include implementation of the California Department of Fish and Game's (DFG) strategic management plan for KMP steelhead ESU, the State's Watershed Protection Program which includes an ongoing habitat restoration program, and the NMFS/California MOA which assures implementation of steelhead angling regulation changes, changes in the management of hatchery steelhead programs, habitat protections on non-Federal land, and expanded steelhead monitoring. In Oregon, these efforts include the implementation of conservation measures contained in the Oregon Plan for Salmon and Watersheds.

Issue 2: Status Assessment for the Northern California Steelhead ESU

Comment 4: Some commenters suggested that risk assessments were made in an arbitrary manner and that NMFS did not rely on the best available science. Several commenters questioned NMFS' methodology for determining whether the Northern California steelhead ESU warranted listing. In

some cases, such commenters also expressed opinions regarding whether listing was warranted.

Response: Throughout the status review for west coast steelhead and all subsequent updates, NMFS has solicited and evaluated the best available scientific and commercial data for the species. NMFS believes that these reviews, coupled with considerable input from the public, co-managers, peer reviewers, and other species experts, clearly demonstrate that its listing determinations are not arbitrary, but instead are based on an open and rigorous scientific assessment.

NMFS has identified a number of factors that should be considered in evaluating the level of risk faced by an ESU, including: (1) absolute numbers of fish and their spatial and temporal distribution; (2) current abundance in relation to historical abundance and current carrying capacity of the habitat; (3) trends in abundance; (4) natural and human-influenced factors that cause variability in survival and abundance; (5) possible threats to genetic integrity (e.g., from strays or outplants from hatchery programs); and (6) recent events (e.g., a drought or changes in harvest management) that have predictable short-term consequences for abundance of the ESU. These factors were considered by NMFS in the original 1996 status review and all subsequent updated reviews (NMFS, 1997a; NMFS, 2000) and served as the basis for agency determinations regarding the biological status of the Northern California steelhead ESU.

Issue 3: Factors Contributing to the Decline of Northern California Steelhead ESU

Comment 5: Some commenters identified factors for decline that were either not identified in the original or updated status reviews or which they believed were not given sufficient weight in the risk analysis. Other commenters contended that recent declines in Northern California steelhead abundance were related to natural factors such as predation and changes in ocean productivity. Furthermore, these commenters contend that NMFS did not show how the present declines were significantly different from natural variability in abundance, nor that abundances were below the current carrying capacity of the marine environment and freshwater habitat.

Response: The status review did not attempt to exhaustively identify factors for decline, except insofar as they contributed directly to the risk analysis. Nevertheless, NMFS agrees that a multitude of factors, past and present,

have contributed to the decline of west coast steelhead. Many of the identified risk factors were specifically cited in NMFS' original west coast steelhead status review (Busby *et al.*, 1996) and subsequent listing notices (61 FR 41541; 63 FR 13347; 65 FR 6960). In addition, NMFS has prepared a report that summarizes the factors leading to the decline of steelhead on the west coast entitled: "Factors for Decline: A supplement to the notice of determination for west coast steelhead" (NMFS, 1996). This report concludes that all of the factors identified in section 4(a)(1) of the ESA have played a role in the decline of the species. The report identifies destruction and modification of habitat, overutilization for recreational purposes, and natural and human-made factors as being the primary causes for the decline of steelhead on the west coast. NMFS recognizes that natural environmental fluctuations have likely played a role in the species' recent declines as well. However, NMFS believes other human-induced impacts (e.g., harvest in certain fisheries, artificial propagation, and widespread habitat modification) have played an equally significant role in the decline of steelhead.

NMFS' 1996 status review briefly addressed the impact of adverse marine conditions and climate change, but concluded that there is considerable uncertainty regarding the role of these factors in steelhead abundance. At this time, we do not know whether these climate conditions represent a long-term shift in conditions that will continue into the future or short-term environmental fluctuations that can be expected to reverse soon (NMFS, 1996). A recent review by Hare *et al.* (1999) suggests that these conditions could be part of an alternating 20- to 30-year regime pattern. These authors concluded that although at-risk salmon stocks may benefit from a reversal in the current climate/ocean regime, fisheries management should continue to focus on reducing impacts from harvest and artificial propagation and improving freshwater and estuarine habitats.

NMFS believes there is ample evidence to suggest that the elimination and degradation of freshwater habitats have contributed to the decline of this steelhead ESU (NMFS, 1996). Many of the identified risks and conclusions apply specifically to Northern California steelhead populations. Examples of habitat alterations affecting steelhead include: water withdrawal, conveyance, storage, and flood control (resulting in insufficient flows, stranding, juvenile entrainment, and increased stream temperatures); and logging and

agriculture (resulting in loss of large woody debris, sedimentation, loss of riparian vegetation, and habitat simplification) (NMFS, 1996; Spence *et al.*, 1996; Busby *et al.*, 1996). These human-induced impacts in freshwater ecosystems have likely reduced the species' resiliency to natural factors for decline such as drought and poor ocean conditions. A critical next step in restoring listed steelhead will be identifying and ameliorating specific factors for decline at both the ESU and population level.

With respect to predation impacts on steelhead, NMFS has recently published reports describing the impacts of California sea lions and Pacific harbor seals upon salmonids and on the coastal ecosystems of Washington, Oregon, and California (NMFS, 1997 and 1999b). These reports conclude that in certain cases where pinniped populations co-occur with depressed salmonid populations, salmonid populations may experience severe impacts due to predation. An example of such a situation is at the Ballard Locks, Washington, where sea lions are known to consume significant numbers of adult winter steelhead. These reports further conclude that data regarding pinniped predation are quite limited and that substantial additional research is needed to fully address this issue. Existing information on the seriously depressed status of many salmonid stocks may be sufficient to warrant actions to remove pinnipeds in areas of co-occurrence where pinnipeds prey on depressed salmonid populations (NMFS, 1997 and 1999b).

Issue 4: Consideration of Existing Conservation Measures

Comment 6: Some commenters expressed concerns about NMFS' reliance and characterization of the efficacy of the Northwest Forest Plan (NFP), citing significant differences in management practices between various Federal land management agencies. Numerous commenters noted that an array of state and Federal conservation measures were underway for this and other species (particularly in northern California) and asked that NMFS give them more consideration in its listing determination.

Response: In the listing proposal, NMFS noted that the NFP requires specific management actions on Federal lands, including actions in key watersheds in southern Oregon and northern California that comply with special standards and guidelines designed to preserve their refugia functions for at-risk salmonids (i.e., watershed analysis must be completed prior to timber harvests and other

management actions, road miles should be reduced, no new roads can be built in roadless areas, and restoration activities are prioritized). In addition, the most significant element of the NFP for anadromous fish is its Aquatic Conservation Strategy (ACS), a regional-scale aquatic ecosystem conservation strategy that includes: (1) special land allocations (such as key watersheds, riparian reserves, and late-successional reserves) to provide aquatic habitat refugia; (2) special requirements for project planning and design in the form of standards and guidelines; and (3) new watershed analysis, watershed restoration, and monitoring processes. These ACS components collectively ensure that Federal land management actions achieve a set of nine ACS objectives that strive to maintain and restore ecosystem health at watershed and landscape scales, to protect habitat for fish and other riparian-dependent species and to restore currently degraded habitats. NMFS will continue to support the NFP strategy and address Federal land management issues via ESA section 7 consultations.

Additional consideration was given to various conservation efforts in California that have been implemented or are expected to be initiated. See "Efforts Being Made to Protect West Coast steelhead" later in this document.

Comment 7: Several commenters expressed their belief that current California Forest Practice Rules (FPR's) were adequate to protect the Northern California steelhead ESU. Several comments expressed concern that NMFS did not adequately review and consider the interim FPR changes adopted by the California Board of Forestry (BOF) for anadromous salmonids in March 2000.

Response: NMFS disagrees with the assertion that the state's FPRs as currently implemented are adequate to protect anadromous salmonids in California. NMFS has reviewed the State FPRs, including those interim changes recently adopted by the Board of Forestry and concludes that they do not adequately protect anadromous salmonids, including steelhead, or provide for properly functioning habitat conditions. In fact, the deleterious impacts of timber harvest and other activities have resulted in recent listings by the Environmental Protection Agency of many north coast California streams as sediment and/or temperature impaired under Section 303(d) of the Clean Water Act.

NMFS' March 19, 1998 (63 FR 13347), decision not to list the Northern California steelhead ESU was based largely on a determination that

sufficient Federal and state conservation measures were in place to reduce threats to the ESU such that the proposed threatened listing was unnecessary. The Federal and state conservation measures upon which NMFS based this determination included the implementation of a March 11, 1998, Memorandum of Agreement (MOA) between NMFS and the State of California (NMFS/California MOA, 1998), with particular importance given to implementation of those provisions in the MOA which were intended to improve non-Federal forest land protections in the ESU. At the time of NMFS' decision not to list the Northern California ESU in 1998, NMFS considered the protection and restoration of freshwater spawning, rearing, and migratory habitat on non-Federal lands to be essential for the long-term survival and recovery of this ESU because non-Federal lands represented such a large portion (81 percent) of the available habitat (63 FR 13347, March 19, 1998; 65 FR 6960, February 11, 2000). Because of NMFS' concerns regarding the preponderance of private timber lands and timber harvest in the northern California ESU, the NMFS/California MOA contained several provisions calling for the review and revision of California's FPRs, and a review of their implementation and enforcement by January 1, 2000. NMFS considered full implementation of these critical provisions within the specified time frame to be essential for achieving properly functioning habitat conditions for steelhead in this ESU. In accordance with the NMFS/California MOA, a scientific review panel was established by the state to review the California FPRs, including their implementation and enforcement. The scientific review panel completed its review and provided the state's Board of Forestry with its findings and recommendations in June 1999. In its findings, the review panel concluded that California's FPRs, including their implementation through the existing timber harvest plan process, do not ensure protection of anadromous salmonid habitat and populations. To address these shortcomings, and as specified in the NMFS/California MOA, the California Resources Agency and CalEPA jointly presented the Board of Forestry with a proposed rule change package in July 1999. Following several months of public review, the Board of Forestry took no action on the package in October 1999, thereby precluding any possibility of implementing improvements in California's FPRs by January 1, 2000, as the State committed to do in the NMFS/California MOA.

The California State Legislature, pursuant to Senate Bill 621, gave special authority to BOF to adopt new rules twice during the year 2000 for the specific purpose of revising the State's FPRs to meet ESA requirements for salmonids. Following its decision to take no action in October 1999, BOF continued working on revisions to the state's FPRs through March 2000. During this period, NMFS and other groups strongly urged BOF to adopt the entire FPR package as a necessary first step for protecting anadromous salmonid habitat. On March 14, 2000, (the deadline for the Board of Forestry to exercise its authority under SB 621), the Board only adopted a subset of rule changes from the package. These rule changes only apply to those harvest plans approved between July 1, 2000, and December 31, 2000. NMFS has reviewed these recently adopted rule changes and has determined that they are inadequate to protect anadromous salmonids or provide for properly functioning habitat conditions. This position is supported by the scientific review panel report of June 1999. For a more detailed discussion on the adequacy of California's FPRs, including the recently proposed interim FPRs changes, see "Inadequacy of Existing Regulatory Mechanisms, Land Management" later in this document.

Comment 8: Several commenters argued that NMFS had not considered existing conservation programs designed to enhance steelhead stocks within the northern California ESU.

Response: NMFS has reviewed existing conservation efforts relevant to the Northern California steelhead ESU and concludes that existing conservation efforts in these areas are not sufficient to preclude listing of the ESU at this time. Several of the plans addressed in comments show promise for ameliorating the risks facing steelhead. However, in most cases, measures described in comments have not been implemented or are in their early stages of implementation and have not yet demonstrated success. Some of these measures are also geographically limited to individual river basins or political subdivisions, thereby improving conditions for only a small portion of the entire ESU.

While existing conservation plans are unable to preclude the need for listing at this time, they are nevertheless valuable for improving watershed health and restoring fishery resources. In those cases where well-developed, reliable conservation plans exist, NMFS may choose to incorporate them into the recovery planning process. In the case of threatened species, NMFS also has

flexibility under ESA section 4(d) to tailor section 9 take regulations based on the contents of available conservation measures. NMFS fully intends to recognize local conservation efforts to the fullest extent possible.

Issue 5: Steelhead Biology and Ecology

Comment 9: Some commenters believe that resident rainbow trout should be included in the Northern California steelhead ESU if it is listed. Several commenters also stated that NMFS should address how the presence of rainbow trout populations may ameliorate risks facing anadromous populations within listed ESUs.

Response: In its August 9, 1996, listing proposal, NMFS stated that based on available genetic information, it was the consensus of NMFS scientists, as well as regional fishery biologists, that resident fish should generally be considered part of the steelhead ESUs, but also concluded that available data were inconclusive regarding the relationship of resident rainbow trout and steelhead. NMFS requested additional data in the proposed rule to clarify this relationship and determine if resident rainbow trout should be included in listed steelhead ESUs.

In response to this request for additional information, many groups and individuals expressed opinions regarding this issue. In most cases these opinions were not supported by new information that resolves existing uncertainty. Two state fishery management agencies (CDFG and WDFW) and one peer reviewer provided comments and information supporting the inclusion of resident rainbow trout in listed steelhead ESUs. In general, these parties also felt that rainbow trout may serve as an important reservoir of genetic material for at-risk steelhead stocks.

While conclusive evidence does not yet exist regarding the relationship of resident and anadromous *O. mykiss*, NMFS believes available evidence suggests that resident rainbow trout should be included in listed steelhead ESUs in certain cases. Such cases include: (1) where resident *O. mykiss* have the opportunity to interbreed with anadromous fish below natural or man-made barriers; or (2) where resident fish of native lineage once had the ability to interbreed with anadromous fish but no longer do because they are currently above human-made barriers, and they are considered essential for recovery of the ESU. Resident fish above long-standing natural barriers, and those that are derived from the introduction of non-native rainbow trout, would not be considered part of any ESU.

NMFS believes resident fish can help buffer extinction risks to an anadromous population by mitigating compensatory effects in spawning populations, by providing offspring that migrate to the ocean and enter the breeding population of steelhead, and by providing a "reserve" gene pool in freshwater that may persist through times of unfavorable conditions for anadromous fish. In spite of these potential benefits, presence of resident populations is not a substitute for conservation of anadromous populations. A particular concern is isolation of resident populations by human-caused barriers to migration. This interrupts normal population dynamics and population genetic processes and can lead to loss of a genetically based trait (anadromy). As discussed in NMFS' "species identification" paper (Waples, 1991), the potential loss of anadromy in distinct population segments may in and of itself warrant listing the species as a whole.

FWS and NMFS adopted a joint policy to clarify their interpretation of the phrase "distinct population segment (DPS) of any species of vertebrate fish or wildlife" for the purposes of listing, delisting, and reclassifying species under the ESA (61 FR 4722). DPSs are "species" pursuant to section 3(15) of the ESA. Previously, NMFS had developed a policy for stocks of Pacific salmon where an ESU of a biological species is considered "distinct" (and hence a species) if (1) it is substantially reproductively isolated from other conspecific population units, and (2) it represents an important component in the evolutionary legacy of the species (November 20, 1991, 56 FR 58612). NMFS believes available data suggest that resident rainbow trout are in many cases part of steelhead ESUs. However, the FWS, which has ESA authority for resident fish, maintains that behavioral forms can be regarded as separate DPSs and that absent evidence suggesting resident rainbow trout need ESA protection, the FWS concludes that only the anadromous forms of each ESU should be listed under the ESA (DOI, 1997; FWS, 1997).

Comment 10: Commenters and some peer reviewers questioned NMFS' inclusion of both summer- and winter-run steelhead in the same ESU. These commenters suggested that summer- and winter-run steelhead be segregated into individual ESUs based on life history differences.

Response: While NMFS considers both life history forms (summer- and winter-run steelhead) to be important components of diversity within the species, new genetic data reinforce

previous conclusions that, within a geographic area, summer- and winter-run steelhead typically are more genetically similar to one another than either is to populations with similar run timing in different geographic areas. This indicates that an ESU that included summer-run populations from different geographic areas but excluded winter-run populations (or vice-versa) would be an inappropriate unit. The only biologically meaningful way to have summer- and winter-run steelhead populations in separate ESUs would be to have a very large number of ESUs, most consisting of just one or a very few populations. This would be inconsistent with the approach NMFS has taken in defining ESUs in other anadromous Pacific salmonids. Taking these factors into consideration, NMFS concludes that summer- and winter-run steelhead should be considered part of the same ESU in geographic areas where they co-occur.

Issue 6: Consideration of ESA Section 4(d) Regulation for Recreational Angling

Comment 11: Numerous commenters requested that if NMFS lists the Northern California steelhead ESU as a threatened species the agency promulgate an ESA 4(d) rule that provides for recreational angling opportunities similar to what is contained in the ESA 4(d) rule NMFS recently proposed for other threatened steelhead ESUs in California (64 FR 73479; December 30, 1999).

Response: The steelhead ESA 4(d) rule that NMFS proposed on December 30, 1999, contains a limitation on the application of the section 9 take prohibitions that would allow recreational angling for steelhead listed as threatened to continue under certain conditions, provided that the State of California prepares a Fishery Management and Evaluation Plan (FMEP) meeting certain criteria and that NMFS approves it. Because the pending steelhead 4(d) rule will be finalized by June 19, 2000, NMFS expects to begin working soon with the State of California and DFG in preparing one or more FMEPs so that recreational angling can continue where it is consistent with the conservation of steelhead listed as threatened. It is NMFS' intent to promulgate an ESA 4(d) rule for the Northern California steelhead ESU which is consistent with the 4(d) rule that will be published on June 19, 2000 so that recreational angling which meets appropriate conservation criteria can continue.

Northern California Steelhead ESU Determination

The Northern California steelhead ESU has been described in previous **Federal Register** documents (61 FR 41541, August 9, 1996; 62 FR 43937, August 18, 1997; 63 FR 13347, March 19, 1998; 65 FR 6960, February 11, 2000) based on analyses conducted by NMFS and summarized in the following documents: "Status Review for West Coast Steelhead from Washington, Idaho, Oregon, and California" (Busby *et al.*, 1996); and "Status Review Update for West Coast Steelhead from Washington, Idaho, Oregon, and California" (NMFS, 1997a). The relationship between hatchery steelhead populations and naturally spawned steelhead within this ESU was also assessed in: "Status Review Update for Deferred ESUs of West Coast Steelhead: Hatchery Populations" (NMFS, 1998a). Copies of these NMFS documents are available upon request (see **ADDRESSES**). NMFS received no new scientific or commercial information as a result of the February 11, 2000, proposal to list this ESU, which indicates that a change in the Northern California ESU is warranted.

The ESU occupies river basins from Redwood Creek in Humboldt County, CA, to the Gualala River, inclusive, in Mendocino County, CA. Dominant vegetation along the coast is the redwood forest, whereas some interior basins, much drier than surrounding areas, are characterized by many endemic species. This area includes the extreme southern end of the contiguous portion of the Coast Range Ecoregion (Omernick, 1987). Elevated stream temperatures are a factor in some of the larger river basins (greater than 20°C), but not to the extent that they are in river basins further south. Precipitation is generally higher in this geographic area than in regions to the south, averaging 100–200 cm of rainfall annually (Donley *et al.*, 1979). With the exception of such major river basins as the Eel, most rivers in this region have peak flows of short duration. Strong and consistent coastal upwelling begins at about Cape Blanco and continues south into central California, resulting in a relatively productive nearshore marine environment.

The northern California ESU includes both winter and summer steelhead, including what is presently considered to be the southernmost population of summer steelhead, in the Middle Fork Eel River. Half-pounder juveniles also occur in this geographic area, specifically in the Mad and Eel Rivers. Snyder (1925) first described the half-

pounder from the Eel River; however, Cramer *et al.* (1995) suggested that adults with the half-pounder juvenile life history may not spawn south of the Klamath River Basin. As with the Rogue and Klamath Rivers which are located in the Klamath Mountains Province ESU, some of the larger rivers in this ESU have migrating steelhead year-round, and seasonal runs have been named. River entry ranges from August through June and spawning from December through April, with peak spawning in January in the larger basins and late February and March in the smaller coastal basins.

Based on the review of steelhead hatchery programs in this ESU (NMFS, 1998a), NMFS' steelhead BRT concluded that the following steelhead hatchery stocks are part of this ESU because they were established from indigenous natural populations and there is limited impact from the inclusion of out-of-basin fish in the broodstock: Van Arsdale Fisheries Station stock (Eel River), the Yager Creek stock (Eel River tributary), Ten Mile River stock, and North Fork Gualala River stock. The BRT concluded that the Mad River hatchery summer steelhead stock is not part of the ESU based on its origin from out-of-basin steelhead populations combined with the mixing of Eel River summer steelhead in the broodstock. Rearing of this stock was terminated at the Mad River hatchery in 1996. The majority of the BRT concluded that the Mad River hatchery winter steelhead stock is not part of this ESU although a minority of the BRT was uncertain regarding its relationship to the naturally spawning population. This stock was founded from South Fork Eel River steelhead (within the ESU, but out of the Mad River basin) and some local Mad River steelhead.

Status of Northern California Steelhead ESU

Section 3 of the ESA defines the term "endangered species" as "any species which is in danger of extinction throughout all or a significant portion of its range." The term "threatened species" is defined as "any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. In its previous status reviews for west coast salmon and steelhead, NMFS has identified a number of factors that should be considered in evaluating the level of risk faced by an ESU, including: (1) absolute numbers of fish and their spatial and temporal distribution; (2) current abundance in relation to

historical abundance and current carrying capacity of the habitat; (3) trends in abundance; (4) natural and human-influenced factors that cause variability in survival and abundance; (5) possible threats to genetic integrity (e.g., from strays or outplants from hatchery programs); and (6) recent events (e.g., a drought or changes in harvest management) that have predictable short-term consequences for abundance of the ESU.

Based on these factors and the best available scientific information, NMFS' BRT first reviewed the status of the northern California ESU in its original coast-wide status review for steelhead (Busby *et al.*, 1996). The BRT concluded that the northern California steelhead ESU was likely to become endangered in the foreseeable future. Population abundance was determined to be very low relative to historical estimates (1930's dam counts), and recent trends were downward in most stocks for which data were. The BRT expressed particular concern regarding sedimentation resulting in part from poor land management practices and channel restructuring due to floods. The abundance of the pikeminnow as a predator in the Eel River was also identified as a significant concern. For the Mad River, in particular, the BRT was concerned about the influence of hatchery stocks both in terms of genetic introgression and the potential for ecological interactions between introduced stocks and native stocks.

The status of the northern California ESU was reassessed by NMFS' BRT in an updated status review following the 6-month period of deferral because of scientific disagreements (NMFS, 1997a). Based on this updated status review, NMFS' BRT once again concluded that northern California steelhead ESU was likely to become endangered in the foreseeable future. The BRT reported that there was *very limited abundance data available for this ESU, particularly for winter-run steelhead*. The most complete data set available in this ESU is a time series of winter steelhead dam counts on the Eel River at Cape Horn Dam. The updated abundance data (through 1997) showed moderately declining long-term and short-term trends in abundance, and the vast majority of these fish were believed to be of hatchery origin. These data show a strong decline in abundance prior to 1970, but no significant trend thereafter. Additional winter steelhead data are available for Sweasy Dam on the Mad River which show a significant decline, but that data set ends in 1963. For the seven populations where recent trend data were available, the only runs

showing recent increases in abundance in the ESU were the relatively small populations of summer steelhead in the Mad River which has had high hatchery production, and winter steelhead in Prairie Creek where the increase may be due to increased monitoring or mitigation efforts.

As in its original assessment, the BRT continued to be concerned about the risks associated with interactions between naturally spawning populations and hatchery steelhead in this ESU. Of particular concern to the BRT was the potentially deleterious impact to wild steelhead from past hatchery practices at the Mad River hatchery, primarily from transfers of non-indigenous Mad River hatchery fish to other streams in the ESU and the production of non-indigenous summer steelhead. These potentially deleterious hatchery practices for summer steelhead ended in 1996.

Habitat degradation and other factors were also of concern to the BRT in its reassessment of the long-term risks to this ESU. Specific factors which the BRT identified included dams on the upper Eel and Mad Rivers, the likely existence of minor blockages throughout the ESU, continuing impacts of catastrophic flooding on the 1960s, and reductions in riparian and instream habitat and increased sedimentation from timber harvest activities. The BRT also cited poaching of summer steelhead and predation by pikeminnow in the Eel River as factors for concern. NMFS' supplemental review of factors affecting west coast steelhead also identified water diversion and extraction, agriculture, and mining as factors affecting habitat conditions for steelhead in this ESU (NMFS, 1996).

In conjunction with NMFS' reconsideration of the Northern California steelhead ESU, the BRT provided a status review update for this ESU [January 2000 Memorandum from Pete Adams, Southwest Fisheries Science Center [SWFSC] to Rodney R. McInnis, Regional Administrator, SWR (NMFS, 2000)]. Based on a review of updated abundance and trend information that was available for this ESU, the SWFSC concluded that the current status of the ESU has not changed significantly since it was last evaluated by NMFS' BRT in December 1997 (NMFS, 1997a). The Eel River winter and summer steelhead populations, which represent the best available data set for this ESU, are still severely reduced from pre 1960's levels. Updated abundance and trend data show small increases for winter and summer steelhead in the Eel River, but current abundance is still well

below estimates in the 1980s, and even further reduced from levels in the 1960s. Redwood Creek summer steelhead abundance remains very low. There are no new data suggesting substantial increases or decreases in populations since the last updated status review was completed. NMFS received no new scientific or commercial data or information as a result of the February 11, 2000, listing proposal which changes the conclusions reached by the SWFSC.

Summary of Factors Affecting the Species

Section 4(a)(1) of the ESA and NMFS' implementing regulations (50 CFR part 424) set forth procedures for listing species. The Secretary of Commerce (Secretary) must determine, through the regulatory process, if a species is endangered or threatened based upon any one or a combination of the following factors: (1) The present or threatened destruction, modification, or curtailment of its habitat or range; (2) overutilization for commercial, recreational, scientific, or education purposes; (3) disease or predation; (4) inadequacy of existing regulatory mechanisms; or (5) other natural or human-made factors affecting its continued existence.

NMFS has prepared a report that summarizes the factors leading to the decline of steelhead on the west coast entitled: "Factors for Decline: A supplement to the notice of determination for west coast steelhead" (NMFS, 1996). This report, available upon request (see ADDRESSES), concludes that all of the factors identified in section 4(a)(1) of the ESA have played a role in the decline of the species. The report identifies destruction and modification of habitat, overutilization for recreational purposes, and natural and human-made factors as being the primary causes for the decline of steelhead on the west coast. NMFS (1996) identified several factors that were considered to have contributed to its decline of the northern California steelhead ESU including: impacts from historic flooding (principally in 1955 and 1964), predation, water diversions and extraction, minor habitat blockages, poaching, timber harvest, agriculture, and mining. NMFS' steelhead BRT also identified the potentially adverse impacts of the release of non-indigenous, hatchery-produced steelhead in this ESU as an important factor, and expressed concerns regarding the lack of reliable abundance and trend data for assessing the status of steelhead in this ESU (NMFS, 1997a).

Finally, NMFS was also concerned about the impacts of recreational angling because of the depressed status of steelhead populations and the uncertainty regarding the status of this ESU (March 11, 1998, Memorandum from William Hogarth to Rolland Schmitt (NMFS, 1998e)). The following discussion briefly summarizes findings regarding factors for decline across the range of west coast steelhead, including the northern California ESU.

The Present or Threatened Destruction, Modification, or Curtailment of Steelhead Habitat or Range

Steelhead on the west coast of the United States have experienced declines in abundance in the past several decades as a result of natural and human factors. Forestry, agriculture, mining, and urbanization have degraded, simplified, and fragmented habitat. Water diversions for agriculture, flood control, domestic, and hydropower purposes have greatly reduced or eliminated historically accessible habitat. Among other factors, NMFS (1996) specifically identified timber harvest, agriculture, mining, habitat blockages, and water diversions as important factors for the decline of steelhead in the northern California ESU. NMFS (1998a) discussed these factors in more detail. Studies estimate that during the last 200 years, the lower 48 states have lost approximately 53 percent of all wetlands and the majority of the rest are severely degraded (Dahl, 1990; Tiner, 1991). Washington and Oregon's wetlands are estimated to have diminished by one-third, while California has experienced a 91 percent loss of its wetland habitat (Dahl, 1990; Jensen *et al.*, 1990; Barbour *et al.*, 1991; Reynolds *et al.*, 1993). Loss of habitat complexity has also contributed to the decline of steelhead. For example, in national forests in Washington, there has been a 58 percent reduction in large, deep pools due to sedimentation and loss of pool-forming structures such as boulders and large woody debris (FEMAT, 1993). Similarly, in Oregon, the abundance of large, deep pools on private coastal lands has decreased by as much as 80 percent (FEMAT, 1993). Sedimentation from land use activities is recognized as a primary cause of habitat degradation in the range of west coast steelhead.

Overutilization for Commercial, Recreational, Scientific, or Education Purposes

Steelhead are not generally targeted in commercial fisheries. High seas driftnet fisheries in the past may have contributed slightly to a decline of this

species in local areas, but could not be solely responsible for the large declines in abundance observed along most of the Pacific coast over the past several decades (NMFS, 1996).

Steelhead support an important recreational fishery throughout most of their range. During periods of decreased habitat availability (e.g., drought conditions or summer low flows when fish are concentrated), the impacts of recreational fishing on native anadromous stocks may be heightened.

Although harvest of steelhead in the Northern California ESU was not originally identified as a major factor for decline (NMFS, 1996), NMFS is concerned about the impacts of recreational angling given currently depressed steelhead population levels and the lack of reliable abundance and trend data for accurately assessing the status of individual populations and the ESU as a whole. Because of NMFS' concerns about recreational angling impacts to naturally reproduced steelhead populations in coastal watersheds in California north of the Russian River, the California Department of Fish and Game (DFG) proposed and the California Fish and Game Commission adopted new steelhead angling regulations in 1998 for all watersheds in the northern California ESU. These new regulations prohibit retention of naturally spawned adult steelhead; eliminate fishing for juvenile steelhead in tributary streams; minimize impacts on juvenile steelhead in mainstem rearing and migratory areas through a combination of gear restrictions and delayed seasonal openings; prohibit retention of summer steelhead during their upstream migration and prohibit fishing in their summer holding areas; and provide for directed harvest and retention of hatchery-produced steelhead which are fully marked state-wide. NMFS (1998b,c,d) analyzed these new regulations and concluded that they would substantially reduce fishing effort and reduce mortality to that associated with catch-and-release of naturally produced steelhead in the northern California ESU. These regulations remain in effect and are enforced by DFG.

Disease or Predation

Infectious disease is one of many factors that can influence adult and juvenile steelhead survival. Steelhead are exposed to numerous bacterial, protozoan, viral, and parasitic organisms in spawning and rearing areas, hatcheries, migratory routes, and the marine environment (NMFS, 1996). Specific diseases such as bacterial

kidney disease (BKD), ceratomyxosis, columnaris, furunculosis, infectious hematopoietic necrosis virus, redmouth and black spot disease, erythrocytic inclusion body syndrome, and whirling disease, among others, are present and are known to affect steelhead and salmon (Rucker *et al.*, 1953; Wood, 1979; Leek, 1987; Foott *et al.*, 1994; Gould and Wedemeyer, undated). Very little current or historical information exists to quantify changes in infection levels and mortality rates attributable to these diseases for steelhead (NMFS, 1996). However, studies have shown that naturally spawned fish tend to be less susceptible to pathogens than hatchery-reared fish (Buchanan *et al.*, 1983; Sanders *et al.*, 1992).

Introductions of non-native species and habitat modifications have resulted in increased predator populations in numerous river systems, thereby increasing the level of predation experienced by salmonids. In the Northern California steelhead ESU, predation from Sacramento pikeminnow that were released into the Eel River is a major problem. Predation from pikeminnow is discussed in more detail in NMFS (1996). The DFG is currently engaged in a program to control pikeminnow predation in the Eel River.

Predation by marine mammals is also of concern in some areas experiencing dwindling steelhead run sizes. NMFS (1997b) reviewed the available literature concerning the impacts of California sea lion and Pacific harbor seal predation on west coast anadromous salmonids, and concluded that there was insufficient data in all but one instance (i.e., Ballard Locks in Puget Sound) to conclude that pinnipeds were having a significant impact on wild salmon or steelhead populations. For this reason, and because of the high likelihood that impacts might be occurring, the study concluded that substantial additional research was needed to address this issue further. Based on this research recommendation, NMFS has initiated several field studies in coastal watersheds on the west coast designed to assess the magnitude of pinniped predation on individual salmon or steelhead populations. In California, these studies are being conducted in the lower Klamath River, Scott Creek, and the San Lorenzo River.

Inadequacy of Existing Regulatory Mechanisms

1. Federal Land and Water Management

The Northwest Forest Plan (NFP) is a Federal land management policy with important benefits for west coast steelhead. While the NFP covers a very

large area, the overall effectiveness of the NFP in conserving steelhead is limited by the extent of Federal lands and the fact that Federal land ownership is not uniformly distributed in watersheds that comprise individual ESUs. The extent and distribution of Federal lands limits the ability of the NFP to achieve its aquatic habitat restoration objectives at watershed and river basin scales, and highlights the importance of complementary salmon habitat conservation measures on non-Federal lands within the subject ESUs.

Federal land ownership and management in the Northern California steelhead ESU is very limited; representing only about 19 percent of the total land area. Federal lands (i.e., Redwood National Park, portions of the Six Rivers and Mendocino National Forests, and the Kings Range National Conservation Area) that do occur in this ESU are also highly fragmented, unlike some other steelhead ESUs (e.g., Klamath Mountains Province and Snake River Basin). Although Federal lands are limited in extent and fragmented in this ESU, NMFS believes that implementation of the NFP on the Six Rivers and Mendocino National Forests lands (upper reaches of Eel and Mad Rivers) and implementation of other habitat protections in Redwood National Park (lower reach of Redwood Creek) will provide some limited benefits to steelhead. Nevertheless, long-term habitat protection and the key to achieving properly functioning habitat conditions in this ESU continues to be improvement in non-Federal land management, particularly those lands used for timber harvest.

Because threatened coho salmon populations occur on Federal lands located within the Northern California steelhead ESU, NMFS routinely engages the U.S. Forest Service (USFS), Bureau of Land Management (BLM), and Redwood Creek National Park in section 7 consultations to ensure that ongoing or proposed activities do not jeopardize coho salmon or adversely modify its critical habitat. Through this section 7 consultation process, NMFS ensures that the NFP and other protective measures are fully implemented on Federal lands that occur in this ESU. The NFP and measures implemented as a result of the section 7 consultations for coho salmon also benefit steelhead.

The Pacific Gas and Electric Company's (PG&E) Potter Valley hydroelectric project is a major diverter of water from the mainstem Eel River, which is located in the northern California ESU. This water is diverted into the Russian River basin to generate hydroelectric power and provide water

for agriculture and urban uses. Pursuant to a Federal Energy Regulatory Commission (FERC) licensing requirement, PG&E implemented a 10-year monitoring program in the Eel River for the purpose of developing recommendations for a flow release schedule and other project facilities and/or operations necessary to protect and maintain fishery resources, including steelhead. This study was completed in 1996, as was construction of a \$14 million dollar fish screen facility at the Van Arsdale Dam diversion on the Eel River. Based on the results of the monitoring study, PG&E has developed a preferred alternative for project operations that, along with several other alternatives, are the subject of National Environmental Policy Act (NEPA) review for ongoing FERC license amendment proceedings. NMFS is currently consulting with FERC pursuant to section 7 of the ESA on PG&E's proposed license amendment.

On March 1, 1999, the Pacific Lumber Company (PALCO), the State of California, the Department of the Interior, and the Department of Commerce entered into a complex land purchase, land exchange and Habitat Conservation Plan (HCP) transaction covering the Headwaters Forest, Elk Head Springs Forest and the remainder of Pacific Lumber Company's land holdings in Humboldt County California. The Federal and State governments acquired approximately 10,000 acres of conifer and hardwood forest, over 3,000 acres of which is ancient redwoods, with some trees over 1,000 years old. This land is now subject to Federal and state control under conservation easements. The PALCO HCP addresses non-Federal timber lands in several drainages that occur in the northern portion of Northern California steelhead ESU. These include portions of several tributaries to Humboldt Bay (Elk River, Jacoby Creek, Freshwater Creek, and Salmon Creek), and portions of the Van Duzen River (including Yager Creek), Eel River, Bear River, Salt River, and Mattole River watersheds. The HCP covers 211,000 acres, has a term of 50 years and covers the following federally listed and candidate anadromous salmonid ESUs: (1) Southern Oregon/Northern California coho salmon (threatened), (2) Northern California steelhead (candidate), and (3) California Coastal Chinook salmon (threatened). The HCP also covers numerous terrestrial species listed under the ESA and California Endangered Species Act.

The HCP's Operating Conservation Program (Program) contains the conservation and management measures

and prescriptions necessary to minimize, mitigate and monitor the impacts of take of the covered species resulting from timber operations. The Program incorporates specific conservation plans for all terrestrial and aquatic species covered under the HCP along with measures to conserve habitat diversity and structural components. Monitoring for implementation, effectiveness and trends is a critical component of the Program. The monitoring component includes an independent third party HCP monitor to determine if the provisions of the aquatics plan are effective and whether the aquatic habitat is responding as expected. There is also a provision for adaptive management if the results are not as predicted. An Aquatics Conservation Plan (ACP) is an integral part of the overall Program. The goal of the ACP is to maintain or achieve over time properly functioning aquatic habitat conditions, which are essential to the long-term survival of salmonids. The reduction in land management impacts and habitat improvement that will be realized through implementation of the ACP will also benefit other species.

NMFS believes that the conservation measures contained in the HCP will protect and provide for long-term conservation of steelhead populations occurring on PALCO lands in the northern California ESU.

2. State Land Management
Timber Harvest. The California Department of Forestry and Fire Protection (CDF) enforces California's FPRs on non-Federal (private and State managed forests) lands. These rules are promulgated through the State Board of Forestry (BOF). Timber harvest activities have been documented to result in adverse effects on streams and stream side zones including the loss of large woody debris, increased sedimentation, loss of riparian vegetation, and the loss of habitat complexity and connectivity (NMFS, 1996).

The vast majority of freshwater habitat in the northern California steelhead ESU (approximately 81 percent of total land) is on non-Federal lands, with the majority being privately owned. For the major river basins in this ESU (i.e., Redwood Creek, Mad River, Eel River, Mattole River, Ten Mile River, Noyo River, Big River, Albion River, Navarro River, Garcia River, and Gualala River), private forest lands average about 75 percent of the total acreage, with a range of 42 percent (Eel River) to 94 (Gualala River) percent.

NMFS reviewed the California FPRs in conjunction with its determination to

not list the Northern California steelhead ESU in 1998 (63 FR 13347). That review concluded that although the FPRs mandate protection of sensitive resources such as anadromous salmonids, the FPRs and their implementation and enforcement do not accomplish this objective. Specific problems with the FPRs include: (1) protective provisions that are not supported by scientific literature; (2) provisions that are scientifically inadequate to protect salmonids including steelhead; (3) inadequate and ineffective cumulative effects analyses; (4) dependence upon registered professional foresters (RPFs) that may not possess the necessary level of multi-disciplinary technical expertise to develop THPs protective of salmonids; (5) dependence by CDF on other State agencies to review and comment on THPs; (6) failure of CDF to incorporate recommendations from other agencies; and (7) inadequate enforcement due to staffing limitations. NMFS further concluded that until a comprehensive scientific peer review process was implemented and appropriate changes to the FPRs and the THP approval process were made, properly functioning habitat conditions would not exist on non-Federal lands in the northern California steelhead ESU.

The NMFS/California MOA which was entered into in March 1998 to ensure the conservation of steelhead populations in northern California (i.e., Northern California and KMP steelhead ESUs) contained specific provisions to address NMFS' concerns over the California FPRs. In the NMFS/California MOA, the State committed to: (1) conduct a scientific review of the State's FPRs, including their implementation and enforcement; (2) make appropriate changes in implementation and enforcement of the FPRs based on this review; and (3) make recommendations to the BOF for changes in the FPRs if they were found to be necessary for the conservation of northern California coastal anadromous salmonids. Full implementation of these provisions in the NMFS/California MOA, including implementation of changes in the FPRs by January 1, 2000, was a critical factor in NMFS's decision previously to not list this ESU.

In accordance with these provisions, a subcommittee of the State's scientific review panel for its Watershed Protection Program was appointed to undertake an independent review of the FPRs. The subcommittee's review and recommendations were completed and presented to the BOF in June 1999. The scientific review panel concluded that California's FPRs, including their

implementation through the timber harvest plan process, do not ensure protection of anadromous salmonid populations. Based in part on the scientific review panel report and findings in July 1999, the California Resources Agency and CalEPA jointly presented the BOF with a proposed rule change package designed to address shortcomings in the State's existing FPRs. The BOF circulated the proposed rule package for public review, held several meetings and two public hearings on the proposals from July until October 1999, but failed to take action to adopt any of the proposed FPR changes, thereby precluding any possibility of implementing improvements in California's FPRs by January 1, 2000, as the State committed to do in the NMFS/California MOA.

The California State Legislature, under Senate Bill 621, gave special authority to the BOF to adopt new rules twice during the year 2000 for the specific purpose of revising the State's FPRs to meet ESA requirements for salmon. Public review and revisions of the BOF's FPR package continued from January 2000 to March 2000, during which time NMFS, California Legislature, the California Department of Forestry, the California Department of Fish and Game, the North Coast Water Quality Control Board, environmental groups and others strongly urged the Board to adopt the package in its entirety as a necessary first step in protecting anadromous salmonid habitat. On March 14, 2000, the deadline for the BOF to exercise its authority under SB 621, the BOF adopted a subset of rule changes from the package which will only apply for those timber harvest plans approved between July 1 and December 31, 2000. During this period, the BOF has committed to work with interested parties in the development of a watershed analysis approach to timber harvest planning.

The interim FPRs changes adopted by the BOF, which sunset December 31, 2000: (1) define watersheds with threatened and impaired values, acknowledging they exist and need special prescriptions; (2) direct analysis on cumulative watershed effects to ensure beneficial uses of water are maintained if in good condition, protected where threatened, and restored where impaired, and that riparian zones be fully protected from site specific and cumulative impacts; (3) require protection and maintenance of stream flow during low water periods, large woody debris recruitment and shade canopy for temperature control; (4) require no measurable increase in

sediment load, no decrease in channel or bank stability and no measurable blockage of aquatic migratory route; (5) define the watercourse transition line as 2 times the bankfull depth for confined channels and the outer edge of the active channel boundary for unconfined channels; (6) identify a 150 foot minimum water and lake protection zone for all fish-bearing streams, with 85 percent overstory shade canopy retained post-harvest for the first 75 feet (22.9 meters (m)), and 65 percent shade retained for the outer 75 feet (22.9 m); (7) require a no-cut buffer in channel zones out to the transition line and large woody debris standards including no salvage logging within the water and lake protection zone without an approved plan; (8) request the registered professional forester identify all active erosion sites and provide remediation; (9) prohibit construction of roads, landings and skid trails during the winter months on slopes over 40 percent; (10) provide specific road construction provisions on slopes over 50 percent; and (11) require that all crossings over fish-bearing streams meet 100-year flood standard and allow for passage of all life stages of fish.

NMFS believes the interim rule changes adopted by the Board of Forestry constitute a good first step in addressing many concerns raised during the FPR review process; however, they are currently inadequate to protect anadromous salmonids, including steelhead, and their habitat. Specifically, the interim rule changes are inadequate because they do not address: (1) site-specific variation and long-term riparian functions; (2) non-fishbearing perennial streams and ephemeral streams that carry water during the winter months; (3) rate of timber harvest in a watershed; (4) all other winter operations and wet weather road and skid trail planning; (5) road planning, construction, maintenance and decommissioning; (6) loss of riparian function and chronic sediment inputs from streamside roads; (7) unstable areas except for inner gorges; (8) timber harvest plan preparation, review, implementation, enforcement and technical validity; (9) harvest plan exemptions and (10) watershed analysis, cumulative effects, adaptive management and monitoring. The adopted rules lack these, and other, critical elements recommended by the scientific review panel as necessary to avoid, minimize and/or mitigate adverse cumulative watershed impacts on salmonid populations.

Multi-County Planning Efforts. As a result of the listing of coho salmon in coastal watersheds in northern

California, the counties of Del Norte, Siskiyou, Trinity, Humboldt and Mendocino developed and have implemented a multi-county, regional approach to assessing and improving county-controlled activities in a way that would enhance the quality and increase the quantity of salmonid habitat that is potentially affected by those county activities. NMFS and the State of California have contributed funding to this multi-county planning effort.

This county-level conservation planning approach involves a thorough review of general plans, ordinances, procedures, practices and policies developed and implemented at the county level. Through the assessment and evaluation of these county-controlled mechanisms, a process is being developed that will enable the counties to exert control at the local level over human activities that can adversely affect anadromous salmonid populations and habitat. This multi-county planning effort was memorialized in a Memorandum of Agreement (Multi-County MOA) which was signed by all five counties in late 1997. Under the terms of the Multi-County MOA, the counties agreed to embark on a cooperative planning and restoration effort; assess the adequacy of existing general plans, county policies and practices, zoning and other land use ordinances; review county management procedures that affect anadromous salmonid habitat in each county; recommend changes to specific county ordinances and/or practices as necessary; develop a watershed-based education and technical assistance/training program for local agencies and decision-makers that will foster better understanding of the linkages between land use and county maintenance practices and salmonid habitat; and seek to establish some form of regulatory recognition at the state and/or federal level. As an example, within the range of the northern California steelhead ESU, the northern five counties (Del Norte, Humboldt, Trinity, Siskiyou, and Mendocino Counties) Conservation Planning Group has organized a program to survey approximately 4700 miles of county roads to identify existing and potential barriers to the passage of listed salmonids in northern California streams. These barriers, which include undersized or failed culverts and other types of road crossings over streams, presently block significant amounts of stream habitat that could otherwise support spawning, rearing and migration of listed salmon and steelhead. To date, all coastal

streams in Del Norte, Humboldt and Mendocino Counties have been inventoried, and habitat assessment and treatment prioritization reports are being drafted (Pers. Comm. Mark Lancaster, Trinity County Planning Dept. with Miles Croom, NMFS, April 24, 2000). In the coastal streams within Del Norte, Humboldt and Mendocino Counties, some 81 barriers have been identified. When removed, an additional 77 miles of suitable salmonid habitat will become available to listed species. The passage barrier inventory is part of a comprehensive aquatic habitat conservation program being developed by the multi-county group to improve county-level policies and procedures in an effort to reduce sedimentation and erosion, protect water quality, establish priorities for repairing problem sites, and institutionalize the utilization of improved practices at the county level with the goal of conserving aquatic habitat for the survival and recovery of listed salmonids.

This multi-county assessment is being used to document the effectiveness of existing regulations. Where the assessment identifies areas for improvement, the planning effort will develop alternative policies, ordinances and practices that are suitable for maintaining or enhancing anadromous salmonid habitat. The assessment will address the need to focus public works projects on sites that improve fisheries habitat. A watershed-based approach will be used, even where watersheds cross county boundaries, to ensure that enhancement efforts are complementary to natural ecosystem processes.

The outcome of this county-level effort is expected to be a comprehensive and coordinated analysis of local land use regulations. Where it is found that development standards such as subdivision restrictions, zoning, and capital improvement programs may not adequately maintain or restore salmonid habitat, model ordinances will be developed for consideration by each of the participating counties. Conversely, innovative approaches for land use (such as density modifications and standards that preserve habitat functions) or other county activities that have been developed in some counties will be presented as options for the other counties. This collaborative, regionally-based planning effort is based on existing environmental, economic, social and administrative concerns and opportunities. At the same time, the planning effort is designed to be complementary with state and national salmonid recovery efforts. The planning process encourages public participation through direct contact with interested

public agencies, landowners, community organizations, environmental groups, industry representatives and others. The public process is being implemented through public hearings, meetings, scoping sessions, forums and other avenues.

Agricultural Activities. Agricultural activity has had multiple and often severe impacts on salmonid habitat. These include depletion of needed flows due to irrigation withdrawals, blocking of fish passage by diversion or other structures, destruction of riparian vegetation and bank stability by grazing or cultivation practices, and channelization resulting in loss of side channel and wetland-related habitat (NMFS, 1996).

Impacts from agricultural and grazing practices have not historically been closely regulated in California. This is an important concern to NMFS because a significant portion of the acreage in the northern California ESU is comprised of farmland. For example, farmland constitutes approximately 25-30 percent of the total acreage of Humboldt and Mendocino counties which in turn constitute much of the northern California ESU. Private lands, and public lands not administered by the Federal government, are now being addressed by the California Rangeland Water Quality Management Program (CRWQMP) which was adopted by the State Water Resources Control Board and CDF in 1995. The CRWQMP is a water quality improvement program based on the voluntary participation of landowners for compliance with state and Federal non-point source pollution reduction requirements. The CRWQMP was initiated as a cooperative effort among the livestock industry, conservation organizations and state and Federal agencies to address the impacts of grazing and land use practices on water quality in streams that flow through private property. Through this Program, private landowners will be able to maintain rangeland productivity and enhance landowners' abilities to manage these lands in a manner that protects water quality standards necessary for the survival and recovery of listed salmonids.

Between 1995-1998, rangeland plans were developed under the CRWQMP for more than 250,000 acres on the north coast ranging from San Francisco to the Oregon border. The State plans to review the implementation status of these plans at intervals of 3, 5 and 10 years, provided resources are available. NMFS is encouraged by these ongoing efforts. Plans that are consistent with this guidance are likely to meet state

water quality standards, but the program is voluntary and it is uncertain to what extent their implementation will contribute to improved habitat conditions and riparian function.

The USDA Natural Resources Conservation Service (NRCS), NMFS, FWS, the U.S. Environmental Protection Agency (EPA), the California Association of Resource Conservation Districts (CARCD), and the State of California (State) have recently developed a joint approach that is expected to encourage the voluntary use of improved conservation management practices for agriculture on private land. Recognizing that recovery of listed and other at-risk salmonid populations depends on the willing participation of private landowners, these agencies have the goal of providing an incentive to landowners to enhance the quality and quantity of habitat needed by species of concern. To accomplish this goal, the agencies have agreed to support cooperative approaches and consensus-building activities, foster communication among agencies and private landowners, share resources and information, and establish strong, effective working relationships that instill trust and promote sound stewardship.

This agreement is the subject of a draft Memorandum of Understanding (MOU) among the partner agencies. Through the procedures described in the MOU, landowners will have the knowledge that practices contained in the NRCS Field Office Technical Guides (FOTG) have undergone ESA section 7 scrutiny by NMFS and FWS. For those practices that NMFS and FWS determine are not likely to adversely affect listed species or critical habitat, the landowner should have confidence that those practices, if implemented in accordance with the FOTG standards and specifications, will not result in any additional permitting requirement or penalties under the ESA. The objective of this MOU is to encourage the adoption of protective land use practices on private lands, to provide some regulatory assurance for landowners, to improve habitat conditions for sensitive species, to continue sustainable economic production on private lands, to facilitate better coordination among the partner agencies and to foster better awareness and support for conservation programs throughout the State. The draft MOU is under review by the State and upon completion is expected to be formally signed by all parties.

3. Dredge, Fill, and In-water Construction Programs

Corps of Engineers Section 404 Program. The Army Corps of Engineers (COE) regulates removal/fill activities under section 404 of the Clean Water Act (CWA), which requires that the COE not permit a discharge that would "cause or contribute to significant degradation of the waters of the United States." One of the factors that must be considered in this determination is cumulative effects. However, the COE guidelines do not specify a methodology for assessing cumulative effects or how much weight to assign them in decision-making. Furthermore, the COE does not have in place any process to address the additive effects of the continued development of waterfront, riverine, coastal, and wetland properties.

The U.S. Army Corps of Engineers, State, and local governments have developed and implemented procedures reviewing, approving and monitoring gravel mining activities in Del Norte and Humboldt counties which are authorized under a Letter of Permission (LOP) process. This process regulates gravel mining in a substantial portion of the Northern California steelhead ESU (including the Mad, Eel and Van Duzen Rivers) where listed coho salmon and chinook salmon populations also occur. These procedures are designed to provide substantially improved protection for anadromous salmonids and their habitats, including steelhead. Important elements of the process include: a prohibition on gravel mining in the active channel and on trenching except in limited instances, a restriction on gravel operations to the dry season, monitoring of channel cross sections to detect changes in channel morphology and habitat conditions, fisheries monitoring, and gravel mining on a sustained yield basis. An additional element of the process in Humboldt County, which is located in the Northern California ESU, is the participation of an independent scientific review committee which makes annual recommendations on gravel quantities and site design features in order to minimize adverse impacts. Additionally, any channel crossings must be designed to allow for fish passage. NMFS participated in the development of these procedures and has concluded, through section 7 consultation with the COE, that these procedures will not jeopardize the continued existence of coho salmon or steelhead. NMFS recently reinitiated formal consultation with the COE on the LOP process to address the final critical habitat designation for coho salmon and the recent listing of California Coastal chinook salmon as threatened.

State Streambed Alteration Agreements. Section 1603 of the Fish and Game Code in California requires that any person who proposes a project that will substantially divert or obstruct the natural flow or substantially change the bed, channel or river bank of any river, stream or lake, or use materials from a streambed, notify the DFG before beginning any work. The authorization for these activities under section 1603 is called a Lake or Streambed Alteration Agreement. Beginning May 1, 1999, the 1603 process was significantly modified to require a higher level of review by DFG that is in compliance with the California Environmental Quality Act (CEQA). Any proposed project that DFG determines may substantially adversely affect existing fish and wildlife resources will need to comply with the CEQA standard of mitigating project impacts to the level of insignificance. The new standard for project review has resulted in increasing the time needed for project approval from two weeks to 60-120 days.

Although the State has substantially improved the level of project review under the 1603 process to comply with the new CEQA standard, the State has not submitted the program to NMFS for review to determine whether it adequately protects anadromous salmonids. The State currently issues 1603 streambed alteration agreements to project applicants with the disclosure that the applicant may need to obtain incidental take authorization from NMFS. In most cases, however, where a project proposes a stream or watercourse modification and listed species are present, a Clean Water Act, section 404 permit from the Army Corps of Engineers is required. Within the geographic area encompassing the northern California steelhead ESU, the presence of listed coho and chinook salmon populations requires the Corps to consult with NMFS under section 7 of the ESA prior to the issuance of 404 permits.

4. Water Quality Programs

Under Clean Water Act section 303(d), states, territories and authorized Tribes are required to establish lists of impaired water bodies, set priorities for addressing the pollutant source, and write pollutant control plans to achieve and maintain water quality standards. These plans, Total Maximum Daily Loads (TMDLs), provide an effective mechanism for determining the causes of water body impairment, quantifying the various pollutant sources, and setting targets for reducing pollutant discharges. Generally, states are responsible for developing TMDLs and related implementation plans, which are

subject to EPA review and approval. If the EPA disapproves a TMDL or if a state fails to establish one, the EPA is required to step in and establish the TMDL. The TMDL is then implemented through existing regulatory and non-regulatory programs to control, reduce or eliminate pollution from both point and non-point sources.

The TMDL process provides a flexible assessment and planning framework for identifying load reductions or other actions needed to attain water quality standards such as protection of aquatic life, provision of safe drinking water, etc. The TMDL should address all significant stressors (e.g., chemicals, temperatures, sediment loads) that cause or threaten to cause deleterious effects to water quality. The TMDL assessment is the sum of the individual waste load allocations from point sources, load allocations from non-point sources, allocation from natural sources, and an appropriate margin of safety to account for uncertainty. The TMDL may address single or multiple pollutants but must clearly identify the links between the water quality impairment (or threat) of concern, the causes of the threat or concern and the load reductions or conservation actions needed to remedy or prevent the impairment.

As TMDL assessments and implementation plans are developed and approved, the State of California, through the State Water Resources Control Board and the nine Regional Water Quality Control Boards, will adopt and implement the TMDLs. The TMDL contains a problem statement, numeric targets, source analysis, allocations of loads or controls and a monitoring plan. The implementation component includes descriptions of land management practices, remediation activities and restoration projects necessary to attain the goals established in the TMDL assessment. It is through the implementation plan that necessary controls and restoration actions are assigned to specific parties and attainment schedules are promulgated.

In coastal watersheds of northern California, 38 water body segments have been identified as impaired and have been scheduled for development of TMDLs. The schedule for development of TMDLs in northern California extends to the year 2011 (Russian River and Lake Pillsbury). However, the schedule in this area is driven in part by a consent decree (*Pacific Coast Federation of Fishermen's Associations, et al. v. Marcus*, No. 95 4474 MHP, March 11, 1997). Under this consent decree, EPA agreed to oversee the development of TMDLs on eighteen rivers on the north coast of California.

Twelve of these river basins are located within the northern California steelhead ESU. The consent decree establishes a schedule for developing TMDL criteria for listed rivers. Under this schedule, seven river basins in the northern California ESU would have TMDLs developed within the next two years, with the remaining rivers having TMDLs developed by 2002. This legally-binding schedule is expected to result in significant progress on improving the beneficial uses of these watersheds, where the beneficial use has been identified as habitat for salmonids.

On May 28, 1998, the North Coast Regional Water Quality Control Board approved a TMDL for the Garcia River. The TMDL contains the following elements: (1) findings that the Garcia River is impaired due to sediment and temperature impacts resulting from land use practices, primarily timber operations and related activities, (2) adoption of the Water Quality Attainment Strategy as part of the Water Quality Control Plan for the North Coast Region (Basin Plan) that would eliminate 90 percent of total controllable road-related sediment sources within 20 years and 50 percent of controllable upslope sediment sources within 40 years, (3) numeric targets including specified numerical values for percent fine sediments, frequency of pools in stream habitat profiles, and improving trends in large woody debris, (4) an implementation plan which specifies that either default prescriptions be observed or a site-specific plan be implemented that provides assurances that source reduction targets will be met, (5) assurances that sediment reduction or control goals are capable of being met and that the concept of site-specific planning and implementation by landowners provides a flexible framework, (6) a monitoring plan to verify that conservation practices are implemented and to measure effectiveness.

The TMDL process provides a flexible, adaptive management approach that relies on substantial public input and participation to set targets, identify protection measures and implement and monitor corrective practices. The completion of the Garcia River TMDL, and the initiation of TMDLs for the other listed rivers, represents a significant step forward in improving watershed health for steelhead and other salmonids on the north coast of California. In the long-term, the development and implementation of these TMDLs should be beneficial for steelhead; however, their development and implementation will be difficult

and it will take many years to assess their efficacy in protecting steelhead habitat. Furthermore, it is essential that the EPA consults with NMFS on the formulation of TMDLs in waters that contain listed salmonids. Such consultations will help ensure TMDLs adequately address the needs of these species.

5. State Hatchery and Harvest Management

Hatchery Management. In an attempt to mitigate the loss of habitat and enhance fishing opportunities, extensive hatchery programs have been implemented throughout the range of steelhead on the west coast. While some of these programs have succeeded in providing fishing opportunities, the impacts of these programs on native, naturally-reproducing stocks are not well understood. Competition, genetic introgression and disease transmission resulting from hatchery introductions may significantly reduce the production and survival of native, naturally-reproducing steelhead (NMFS, 1996). Collection of native steelhead for hatchery broodstock purposes often harms small or dwindling natural populations. Artificial propagation can play an important role in steelhead recovery through carefully controlled supplementation programs.

In the past, non-native steelhead stocks have been introduced as broodstock in hatcheries and widely transplanted in many coastal rivers and streams in California (Bryant, 1994; Busby *et al.*, 1996; NMFS, 1997a). Because of problems associated with this practice, DFG has developed and implemented a Salmon and Steelhead Stock Management Policy. This policy recognizes that mixing of non-native stocks with native stocks is detrimental, and seeks to maintain the genetic integrity of all identifiable stocks of salmon and steelhead in California, as well as to minimize interactions between hatchery and natural populations.

NMFS's BRT identified the potentially adverse impacts of interactions between hatchery (Mad River hatchery) and wild steelhead as an important concern with regard to the northern California ESU (NMFS, 1997a). As part of its strategic management plan for this ESU, DFG has implemented several changes in its hatchery practices. In addition, DFG has implemented several additional measures pursuant to the 1998 NMFS/California MOA. These hatchery management measures include: (1) marking of all hatchery steelhead released from the Mad River hatchery and all cooperative rearing facilities in

the Northern California ESU; (2) continuation of long-standing hatchery management practices aimed at minimizing hatchery and wild steelhead interactions including prohibitions on stocking of resident trout in anadromous waters; (3) releasing hatchery steelhead only at times, sizes and places that minimize impacts on naturally produced fish; (4) only releasing hatchery fish that are determined to be healthy; (5) initiation of monitoring efforts intended to measure hatchery fish stray rates; and (6) a joint NMFS/DFG review of the Mad River hatchery including its stocking history, analysis of current broodstock, and its consistency with the strategic management plan for the northern California ESU.

Fisheries Management. In conjunction with the improved hatchery management practices, in-river sport fisheries in the northern California ESU now focus on harvest of marked, hatchery-produced steelhead, and sport fishing regulations have been modified to protect wild adult and juvenile steelhead.

Other Natural or Human-Made Factors Affecting Continued Existence of Steelhead

Natural climatic conditions have exacerbated the problems associated with degraded and altered riverine and estuarine habitats. Persistent drought conditions have reduced already limited spawning, rearing and migration habitat. Climatic conditions appear to have resulted in decreased ocean productivity which, during more productive periods, may help offset degraded freshwater habitat conditions (NMFS, 1996).

Efforts Being Made to Protect West Coast Steelhead

Section 4(b)(1)(A) of the ESA requires the Secretary of Commerce to make listing determinations solely on the basis of the best scientific and commercial data available after conducting a review of the status of the species and after taking into account efforts being made to protect the species. Therefore, in making its listing determinations, NMFS first assesses the status of the species and identifies factors that have led to the decline of the species. NMFS then assesses conservation measures to determine if they ameliorate risks to the species.

In judging the efficacy of existing conservation efforts, NMFS considers the following: (1) the substantive, protective, and conservation elements of such efforts; (2) the degree of certainty such efforts will be reliably

implemented; and (3) the presence of monitoring provisions that determine effectiveness and that permit adaptive management. In some cases, conservation efforts may be relatively new and may not have had time to demonstrate their biological benefit. In such cases, provisions for adequate monitoring and funding of conservation efforts are essential to ensure intended conservation benefits are realized.

As part of its west coast steelhead status review, NMFS reviewed an array of protective efforts for steelhead and other salmonids, ranging in scope from regional strategies to local watershed initiatives. NMFS summarized some of the major efforts in a document entitled "Steelhead Conservation Efforts: A Supplement to the Notice of Determination for West Coast Steelhead under the Endangered Species Act" (NMFS, 1996c). NMFS also reviewed conservation measures being implemented by the State of California for steelhead at the time of its final listing determination for the northern California, Klamath Mountains Province, and Central Valley steelhead ESUs (63 FR 13347, March 19, 1998). The following sections update the current status of the State of California's conservation efforts for steelhead with particular emphasis on the northern California steelhead ESU.

The state of California's conservation efforts that address steelhead in the northern California ESU include: (1) development of the State's Watershed Protection Program, which includes funding and implementation of an expanded watershed planning and habitat restoration program; (2) implementation of the DFG's strategic management plan for the northern California ESU and (3) implementation of the 1998 NMFS/California MOA which addresses management of coastal steelhead in northern California. The status of these conservation efforts is discussed in more detail below.

California Watershed Protection Program and Implementation of SB 271

In July 1997, California's Governor created the State's Watershed Restoration and Protection Council (WPRC) for the purpose of: (1) overseeing all state activities aimed at watershed protection and enhancement, including the conservation and restoration of anadromous salmonids in California; and (2) directing the development of a California Watershed Protection Program that would provide for the conservation of anadromous salmonids in the state of California. A working group of the WPRC issued a detailed report in December, 1998

entitled "Protecting California's Anadromous Fisheries." The Executive Order that established this program expired in January, 1999; however, continued coordination of the program is occurring under the auspices of the California Biodiversity Council (CBC). NMFS is encouraged that the State initiated a comprehensive, watershed-based approach to salmon management and restoration; however, the California Watershed Protection Program is still under development and has not been implemented as originally envisioned.

To support the Governor's WPRC and its efforts to develop a Watershed Protection Program, DFG implemented a \$3 million Watershed Initiative in 1997-98 for coastal watershed projects north of San Francisco, through its Fishery Restoration Grants Program. These projects focused on watershed and riparian habitat restoration, instream habitat restoration; watershed evaluation, assessment, and planning; and restoration project maintenance and monitoring. Beginning in 1998-1999, DFG funded additional staff positions to assist in watershed planning efforts and grant proposal development.

A key element of the State's Watershed Protection Program that is also specified in the 1998 NMFS/California MOA is DFG's implementation of an expanded habitat restoration program for coastal salmonids, including steelhead. In 1997, the California legislature enacted Senate Bill 271 which provided DFG with \$43 million over six years for habitat restoration and watershed planning to benefit anadromous salmonids in coastal watersheds, including the geographic area which encompasses the northern California steelhead ESU. The program was initiated in 1997-98 and has expanded since that time. Based on the SB 271 legislation, funding is expected to continue through at least 2002. Substantial funding from this program has been committed to habitat restoration, enhancement, and watershed planning efforts within the northern California steelhead ESU since 1997-98. Throughout Humboldt and Mendocino counties, which constitute much of the geographic area comprising the northern California steelhead ESU, DFG has funded over 200 projects costing in excess of \$7.5 million during the past three years (1997-98 through 1999-2000). NMFS participates as an ex-officio member of the Advisory Committee that reviews the distribution of SB 271 grant funding to ensure that available funds are spent on projects that will contribute to the conservation of listed salmonids as well as north coast steelhead. In addition to the

expanded habitat restoration program funded by SB 271, DFG has added additional staff positions to assist in administering the program, provide technical support in the development of watershed plans and habitat restoration projects and implement a new steelhead monitoring and adaptive management program throughout coastal northern California.

Northern California Steelhead ESU Strategic Plan

In February 1998, DFG completed its strategic management plan for steelhead stocks in the northern California ESU (DFG 1998). In March 1998, the State and DFG formally committed to implement this plan as part of the NMFS/California MOA. The plan describes existing and new management measures for recreational steelhead angling, steelhead hatchery programs, and steelhead monitoring, assessment and adaptive management efforts in this ESU. In addition, the plan describes DFG's ongoing efforts to protect and enhance steelhead habitat within this ESU. These management measures were intended to provide immediate protection for steelhead populations in this ESU, while longer-term measures were implemented to protect anadromous fish habitat on non-federal lands through the Watershed Protection Program and the SB 271 habitat restoration program. The main elements of the northern California steelhead strategic management plan are briefly discussed here.

1. Harvest Measures

The strategic management plan includes several harvest management actions which are intended to reduce impacts on adult and juvenile steelhead in the Northern California ESU. These include: (1) no retention of unmarked (i.e., naturally produced) adult and juvenile steelhead in all rivers and streams; (2) fishing closures in steelhead rearing tributaries to protect juveniles; (3) expanded closures in mainstem rivers through May to protect outmigrating juvenile steelhead; and (4) various gear and bait restrictions designed to reduce mortality associated with incidental hooking of steelhead.

In February and March 1998, the California Fish and Game Commission (Commission) adopted emergency changes to the State's inland fishing regulations which were intended to implement the harvest regulation changes contained in the northern California steelhead strategic management plan. In conjunction with the final listing determination for this ESU in March 1998 (63 FR 13347), NMFS reviewed these regulatory

changes and concluded that they would substantially reduce impacts to adult and juvenile steelhead and also assist in the conservation of the ESU (NMFS, 1998). These emergency regulations were formally enacted by the Commission in June 1998 following public review and comment, and they currently remain in place. NMFS believes that these angling regulations continue to provide the reduction in impacts and conservation benefits that were expected at the time the decision was made not to list this ESU in March 1998.

2. Hatchery Measures

The strategic plan for the northern California ESU contains a wide range of existing and new hatchery management measures that are intended to reduce the impacts of hatchery steelhead programs on wild steelhead populations in this ESU. Measures incorporated into the plan include: (1) release strategies that require a minimum 6" size and release at the hatchery rather than off-site; (2) marking of all hatchery-produced fish that are released and the implementation of spawner surveys to assess the extent to which hatchery fish stray into natural spawning areas; (3) a commitment to reduce hatchery releases or implement other changes in hatchery practices if significant straying of hatchery fish is found to occur; (4) a cap on hatchery production to current levels, regular health checks during each rearing cycle and the destruction of diseased fish that cannot be effectively treated; (5) a review of the existing operating procedures for all cooperative rearing facilities permitted by the State; and (6) adoption of a requirement that all cooperative facilities develop and submit five-year management plans to the State for approval. NMFS previously reviewed these existing and new hatchery management measures and concluded that they would substantially reduce potential impacts to wild steelhead (NMFS, 1998d). Because of NMFS concerns regarding the operations of the the Mad River Hatchery which is located in this ESU, DFG also committed in the 1998 NMFS/California MOA to: (1) undertake a comprehensive review of the hatchery program, including its stocking history and genetic analysis of current broodstock; and (2) develop a plan to eliminate any adverse impacts of hatchery operations on northern California steelhead if necessary.

The DFG implemented a statewide mass-marking program for its hatchery steelhead programs beginning in 1997 which includes the hatchery steelhead programs in the northern California steelhead ESU. DFG is also requiring all

cooperative rearing programs that produce steelhead in this ESU to mark all released fish. This marking program has continued since its implementation in 1997 and DFG is committed to continuing this program into the future. The DFG and the NMFS have also initiated a comprehensive review of DFG's hatchery programs in this ESU (Mad River Hatchery and cooperative rearing programs), with the objective of ensuring that these programs are compatible with the conservation of naturally produced steelhead. This review is expected to be completed in 2000. Comprehensive monitoring of stray rates for hatchery produced fish has not been implemented in this ESU, but DFG expects to begin a north coast steelhead monitoring program in 2000.

3. Steelhead Monitoring and Adaptive Management

The strategic management plan for the northern California ESU identifies ongoing and expanded monitoring programs to assess steelhead abundance. A commitment to implement these programs is contained in the 1998 NMFS/California MOA. A key element of this monitoring program was a commitment to establish a joint scientific and technical team including representatives from DFG and NMFS to design appropriate detailed monitoring programs for steelhead in this ESU. NMFS considered these monitoring efforts critically important given the uncertain status of steelhead populations in these ESUs, and indicated that adequate State funding was critical to implementing the program (63 FR 13347, March 19, 1998). As part of the NMFS/California MOA, both DFG and NMFS committed to seek adequate funding for this program. The DFG has taken significant steps to implement this expanded steelhead monitoring program in the northern California steelhead ESU, but the full program has not been yet fully developed or implemented. The DFG has committed significant fiscal resources to hire and redirect existing staff resources to create a north coast steelhead monitoring team and program that will address the northern California steelhead ESU as well as areas further north in California, and has established a scientific and technical team to guide development of this effort. A set of comprehensive monitoring proposals have been developed which are under review by the scientific and technical team. NMFS expects the finalized monitoring program for this ESU to be implemented in early 2000.

NMFS/California Memorandum of Agreement

NMFS evaluated a wide range of conservation efforts that California had adopted or was in the process of developing in conjunction with NMFS' decision not to list the northern California steelhead ESU (63 FR 13347, March 19, 1998). NMFS concluded that DFG's harvest and hatchery programs for this ESU would increase adult escapement, increase juvenile survival, and reduce adverse impacts of hatchery populations on wild fish. In the near-term, NMFS expected these measures would contribute to improved survival and population stability for steelhead. In addition, DFG's monitoring and adaptive management programs were expected to provide State and Federal managers with the ability to assess the status of steelhead populations and their response to harvest and hatchery management changes. However, NMFS was also concerned that California's habitat protection efforts, (e.g., development of a Watershed Protection Program and implementation of the expanded habitat restoration program established by SB 271), were not adequate to secure properly functioning habitat conditions for this ESU over the long-term. To address these concerns, NMFS entered into a MOA with the State (NMFS/California MOA, 1998).

Under the terms of the NMFS/California MOA, the State committed to a broad range of measures including: (1) compliance with existing State regulations, with particular emphasis on the management measures contained in the strategic management plans for north coast steelhead; (2) implementation of harvest and hatchery management measures contained in the strategic management plan for northern California steelhead; (3) implementation of a monitoring evaluation and adaptive management program for steelhead, including those elements contained in the strategic management plan for northern California steelhead; (4) continued implementation of a California Watershed Protection Program, including the SB 271 watershed planning and habitat restoration program in coastal watersheds, and the joint review and revision of the State's forest practice rules (FPRs) in conjunction with a scientific review panel to ensure that the revised FPRs were adequate to conserve anadromous salmonids, including steelhead. As previously discussed, because of the preponderance of private timber lands and timber harvest activity in the northern California ESU, NMFS

considered this to be a critically important provision in the MOA.

Many of the provisions in the NMFS/California MOA relating to the northern California steelhead ESU have been or are being implemented by the State; however, critically important provisions related to revision of the FPRs have not been implemented. The current status of the State's effort to implement the MOA, with particular regard to the Northern California steelhead ESU, is discussed here.

1. Compliance with existing State regulations

In accordance with section 4 of the NMFS/California MOA, the DFG made recommendations to the Fish and Game Commission to implement detailed angling regulation changes contained in the strategic management plan for northern California steelhead. The Commission adopted these recommendations on an emergency basis in February 1998 and permanent regulations became effective in August 1998. Within this ESU, these regulations specifically prohibit retention of naturally spawned adult steelhead, prohibit fishing for naturally produced juvenile steelhead in tributary streams, minimize the angling impacts on juvenile steelhead in mainstem rearing areas through gear/bait restrictions, prohibit retention of summer steelhead and prohibit fishing in their summer holding areas and provide for the retention of marked, hatchery-produced steelhead.

2. Harvest and Hatchery Management

In accordance with section 6 of the NMFS/California MOA, two provisions have been implemented. First, the DFG recommended and the Fish and Game Commission adopted permanent regulations that provide only for the retention of non-listed, hatchery-produced steelhead. Second, the DFG has implemented a state wide mass marking program for hatchery produced steelhead. This program was initiated with brood year 1997 steelhead released in winter 1998, and the marking program has continued annually since that time. This program has resulted in complete marking of all steelhead produced at the Mad River Hatchery, which is located in this ESU. In addition, DFG is requiring that all cooperative rearing programs that produce steelhead mark them prior to release.

Three additional provisions contained in section 6 of the NMFS/California MOA have not yet been implemented, but are either in progress or will be initiated shortly. To date, DFG has not implemented a process for establishing recovery and strategic goals for north

coast steelhead, including this ESU, nor has it initiated a monitoring program to measure stray rates of hatchery produced steelhead. However, the DFG has established a North Coast Steelhead Monitoring Program to develop and implement a monitoring program, which will include the northern California steelhead ESU, and a joint scientific and technical team to provide guidance to the program. DFG has developed a preliminary monitoring program and is consulting the joint scientific and technical team to refine the program and explore options for establishing recovery and strategic goals within this ESU. NMFS anticipates that this program will commence in 2000. Although the monitoring program specified in the NMFS/California MOA has not been fully implemented, DFG has continued to carry out several monitoring and research programs on the north coast, primarily in the Klamath Mountains Province ESU, which have provided data useful for the management of steelhead. Finally, NMFS and DFG have recently undertaken a state-wide review of the State's hatchery programs, including the Mad River Hatchery which is located in this ESU, as well as the State's cooperative rearing program which has a small number of projects within this ESU. This review is expected to be completed by June 2000.

3. Monitoring Evaluation and Adaptive Management

In accordance with section 7 of the NMFS/California MOA, the DFG has implemented, at least in part, two key provisions. First, the DFG has established a joint scientific and technical team to assist it with the development of a comprehensive monitoring program for steelhead on the north coast, including the northern California ESU. The NMFS/California MOA called for this program to be developed by June 1998; however, as discussed in the preceding section, DFG has not yet completed development of the study plan or initiated a comprehensive monitoring program. Second, the DFG has secured the necessary funding to establish a north coast steelhead monitoring program, including the dedication of professional staff and the acquisition of necessary equipment and facilities. A preliminary monitoring program plan has been developed by the monitoring program staff, and this plan is currently under review by the joint scientific and technical team.

4. California's Watershed Protection Program

Section 9 of the NMFS/California MOA commits the State to continue

development of its Watershed Protection Program, with a specific element addressing salmonid conservation, and to coordinate with NMFS in establishing a scientific review panel that would advise the State in its development of this program. In addition, Section 9 commits the State to direct personnel and fiscal resources to implement an expanded habitat restoration program in coastal watersheds using SB 271 funds. Details of the State's Watershed Protection Program and DFG's efforts to implement expanded watershed planning and habitat restoration in coastal watersheds were described previously (see Efforts Being Made to Protect West Coast Steelhead).

Section 9 of the NMFS/California MOA contains several measures relating to the review and revision of the State's FPRs because of NMFS's concerns regarding the effects of State-regulated timber harvest freshwater habitat conditions for anadromous salmonids, including steelhead in the Northern California ESU. Specifically, the NMFS/California MOA calls for: (1) a joint review of the FPRs by NMFS and the State, including their implementation and enforcement, (2) the State to make appropriate changes in implementation and enforcement, if necessary, (3) the State, in consultation with NMFS, to make recommendations to the BOF for changes in the FPRs necessary to conserve anadromous salmonids, and (4) the BOF to complete action on the recommended changes in the FPRs by January 2000. Full implementation of these NMFS/California MOA provisions, including implementation of changes in the FPRs by January 1, 2000, was a critical factor in NMFS's decision to not list the northern California steelhead ESU. For details of the State's current FPRs, including the recently adopted interim FPR changes, see Inadequacy of Existing Regulatory Mechanisms.

Listing Determination

Section 3 of the ESA defines an endangered species as any species in danger of extinction throughout all or a significant portion of its range, and a threatened species as any species likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. Section 4(b)(1) of the ESA requires that the listing determination be based solely on the best scientific and commercial data available, after conducting a review of the status of the species and after taking into account those efforts, if any, being made to protect such species.

In December 1997, the NMFS' steelhead BRT concluded that the Northern California steelhead ESU was likely to become endangered in the foreseeable future based on a review of the best available biological information (NMFS, 1997). Based on a review of updated abundance and trend information that was available for this ESU, NMFS's SWFSC (NMFS, 2000) concluded that the current biological status of the ESU has changed little since it was last evaluated in 1997. Updated abundance and trend data show small increases for winter and summer steelhead in the Eel River, but current abundance is well below estimates in the 1980s and even further reduced from levels in the 1960s. Redwood Creek summer steelhead abundance remains very low. There are no new data suggesting substantial increases or decreases in populations since the last updated status review was completed. The Eel River winter and summer steelhead populations, which represent the best available data set for this ESU, are still severely reduced from pre 1960s levels.

As discussed elsewhere in this final rule, California has implemented several of the conservation measures that NMFS relied upon in making its decision not to list the northern California ESU. Specifically, the State has enacted substantial changes to the State's in-river angling regulations in 1998 to protect coastal steelhead populations including steelhead in this ESU. These regulations, with slight modification, remain in effect, and NMFS believes they continue to provide the substantial protection and conservation benefits that were expected to occur at the time of the decision not to list this ESU. The State has also implemented, or begun to implement, several other conservation measures for this ESU, including extensive watershed planning and/or habitat restoration through the SB 271 program, marking of hatchery produced steelhead and other improvements in hatchery practices, and steelhead monitoring. Although implementation of some of these measures has been delayed, as is the case for the steelhead monitoring program, NMFS continues to believe that these efforts will collectively benefit steelhead in this ESU and eventually contribute to an improved understanding of its status.

Although these conservation efforts are expected to benefit steelhead in this ESU, NMFS continues to believe that improved habitat protection and restoration of properly functioning freshwater habitat conditions for spawning, rearing, and migration are essential to the long-term survival and

recovery of this ESU. Because Federal land ownership is both fragmented and limited in this ESU (approximately 19 percent of ESU), the key to achieving habitat protection and properly functioning habitat conditions in this ESU is the improvement of land management activities on non-Federal lands (approximately 81 percent of ESU). To ensure improved protection of habitat on non-Federal lands in this ESU, the NMFS/California MOA contained several provisions for the review and modification of the State's FPRs. Full implementation of these provisions, including implementation of changes in the FPRs by January 1, 2000, was a critical factor in NMFS's previous decision not to list this ESU. Because the State has not implemented changes in the FPRs necessary to protect steelhead in this ESU, NMFS believes that critically important conservation measures are not being implemented to reduce the threats to this ESU from timber harvest activities on non-Federal lands. Consequently, NMFS concludes that existing State and Federal conservation measures collectively fail to provide for the attainment of properly functioning habitat conditions necessary to provide for the long-term protection and conservation of this ESU.

Based on a review of the best available information, therefore, NMFS concludes that the Northern California steelhead ESU warrants listing as a threatened species at this time. In arriving at this determination, NMFS carefully considered the December 1997 scientific conclusions of the BRT regarding this ESU, the results of an updated status review for the ESU (NMFS, 2000), the status of State and Federal conservation efforts directed at protecting steelhead in this ESU, including implementation of provisions contained in the NMFS/California MOA.

NMFS previously examined the relationship between hatchery and natural populations of steelhead in this ESU, and also assessed whether any hatchery populations are essential for their recovery. At this time, NMFS does not believe any specific hatchery populations in this ESU are essential for recovery and therefore none are listed. Accordingly, only naturally reproduced populations of steelhead and their progeny in this ESU are listed as a result of this determination.

However, the determination that a hatchery stock is not essential for recovery at this time does not preclude it from playing a role in recovery in the future if such a conservation measure is warranted. Any hatchery population that is part of the ESU is potentially

available for use in recovery if circumstances warrant it. In this context, an essential hatchery population is one that is vital to incorporate into recovery efforts. If in the future any hatchery population in this ESU is determined to be essential for recovery and is integrated into recovery efforts, NMFS will consider taking the administrative action of listing that hatchery population.

NMFS' "Interim Policy on Artificial Propagation of Pacific Salmon Under the Endangered Species Act" (58 FR 17573, April 5, 1993) provides guidance on the treatment of hatchery stocks in the event of a listing. Under this policy, "progeny of fish from the listed species that are propagated artificially are considered part of the listed species and are protected under the ESA."

For unlisted hatchery populations that are part of the Northern California ESU, NMFS believes it may be desirable to incorporate naturally spawned, listed fish into the broodstock to ensure that its genetic and life history characteristics do not diverge significantly from natural populations. Therefore, NMFS may allow the collection of broodstock for this use if it is consistent with an acceptable conservation plan (e.g., Hatchery and Genetic Management Plan) for the ESU. If listed fish are used as broodstock consistent with an acceptable conservation plan, NMFS may determine that it is not necessary to consider the progeny of intentional hatchery x listed crosses as listed fish (except in those cases where the hatchery population is listed as well). NMFS believes this is consistent with NMFS' interim policy and with the policy and purposes of the ESA.

At this time, NMFS is only listing the anadromous life forms of *O. mykiss*.

Prohibitions and Protective Measures

Section 4(d) of the ESA requires NMFS to issue protective regulations it finds necessary and advisable to provide for the conservation of threatened species. Section 9 of the ESA prohibits violations of protective regulations for threatened species promulgated under ESA section 4(d). The ESA 4(d) protective regulations may prohibit, with respect to the threatened species, some or all of the acts which section 9 of the ESA prohibits with respect to endangered species. These ESA section 9 prohibitions and 4(d) regulations apply to all individuals, organizations, and agencies subject to U.S. jurisdiction. NMFS intends to develop and promulgate an ESA 4(d) protective regulation for the northern California steelhead ESU in a separate rulemaking.

The process for completing the ESA 4(d) rule will provide the opportunity for public comment on the proposed protective regulations.

In the case of threatened species, NMFS has flexibility under ESA section 4(d) to tailor the protective regulations to provide for the conservation of the species. Even though existing conservation efforts and plans are not sufficient to preclude the need for listing at this time, they are nevertheless valuable for improving watershed health and restoring fishery resources. In those cases where well-developed, reliable conservation plans exist, NMFS may choose to incorporate them into the recovery planning process, starting with the protective regulations. For example, the interim ESA 4(d) rule for the Southern Oregon/Northern California coho (62 FR 24588, May 7, 1997) does not prohibit habitat restoration activities conducted in accordance with approved plans or fisheries under an approved state management plan. NMFS recently proposed ESA 4(d) regulations for 14 ESUs of steelhead and salmon (64 FR 73479). Any future ESA 4(d) protective regulation for the Northern California steelhead ESU is likely to be comparable to the 4(d) regulations proposed for steelhead, and therefore, contain limitations on the section 9 take prohibitions for activities such as recreational angling, artificial propagation, habitat restoration, scientific research and other activities when they are conducted in accordance with approved conservation plans.

Sections 7(a)(2) and 7(a)(4) of the ESA require Federal agencies to consult with NMFS to ensure that activities they authorize, fund, or conduct are not likely to jeopardize the continued existence of a listed species or a species proposed for listing, or adversely modify critical habitat or proposed critical habitat. Examples of Federal actions likely to affect steelhead in the Northern California ESU include authorized land management activities of the USFS and BLM, operation of hydroelectric and storage projects permitted by FERC, and activities permitted by the Corps of Engineers. Such activities may include timber sales and harvest, permitting livestock grazing, hydroelectric power generation, and flood control. Other Federal actions, including the Corps section 404 permitting activities under the CWA and section 10 permitting under the Rivers and Harbors Act, and FERC licenses for non-Federal development and operation of hydropower may also require consultation.

Sections 10(a)(1)(A) and 10(a)(1)(B) of the ESA provide NMFS with authority

to grant exceptions to the ESA's "take" prohibitions. Section 10(a)(1)(A) scientific research and enhancement permits may be issued to entities (Federal and non-Federal) for scientific purposes or to enhance the propagation or survival of a listed species. NMFS has issued section 10(a)(1)(A) research/enhancement permits for listed chinook salmon and steelhead for a number of activities, including trapping and tagging, electroshocking to determine population presence and abundance, removal of fish from irrigation ditches and collection of adult fish for artificial propagation programs.

Section 10(a)(1)(B) incidental take permits may be issued to non-Federal entities performing activities which may incidentally take listed species so long as the taking is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. The types of activities potentially requiring a section 10(a)(1)(B) incidental take permit include the operation and release of artificially propagated fish by state or privately operated and funded hatcheries, state or academic research not receiving Federal authorization or funding, logging, road building, grazing, and diverting water into private lands.

Take Guidance

NMFS and the FWS published in the **Federal Register** on July 1, 1994 (59 FR 34272), a policy that NMFS shall identify, to the maximum extent practicable at the time a species is listed, those activities that would or would not constitute a violation of section 9 of the ESA. The intent of this policy is to increase public awareness of the effect of this listing on proposed and ongoing activities within the species' range. NMFS believes that the following actions are not likely to be prohibited in an ESA 4(d) rule and therefore will not result in a violation of section 9:

1. Possession of steelhead from any steelhead ESU listed as threatened which are acquired lawfully by permit issued by NMFS pursuant to section 10 of the ESA, or by the terms of an incidental take statement pursuant to section 7 of the ESA.

2. Federally funded or approved projects that involve activities such as silviculture, grazing, mining, road construction, dam construction and operation, discharge of fill material, stream channelization or diversion for which section 7 consultation has been completed, and when activities are conducted in accordance with any terms and conditions provided by NMFS in an incidental take statement accompanying a biological opinion.

Activities that NMFS believes could potentially harm steelhead in the northern California ESU and, therefore, may be prohibited in a 4(d) rule applying section 9 take prohibitions, include, but are not limited to:

1. Land-use activities that adversely affect steelhead habitat in the proposed ESU (e.g., logging, grazing, farming, urban development, road construction in riparian areas and areas susceptible to mass wasting and surface erosion).
2. Destruction/alteration of the steelhead habitat in the proposed ESU, such as removal of large woody debris and "sinker logs" or riparian shade canopy, dredging, discharge of fill material, draining, ditching, diverting, blocking, or altering stream channels or surface or ground water flow.
3. Discharges or dumping of toxic chemicals or other pollutants (e.g., sewage, oil, gasoline) into waters or riparian areas supporting steelhead in the proposed ESU.
4. Violation of discharge permits.
5. Pesticide applications.
6. Interstate and foreign commerce of steelhead from the listed ESU and import/export of steelhead from any ESU without a threatened or endangered species permit.
7. Collecting or handling of steelhead from the listed ESUs. Permits to conduct these activities are available for purposes of scientific research or to enhance the propagation or survival of the species.
8. Introduction of non-native species likely to prey on steelhead in the listed ESU or displace them from their habitat.

These lists are not exhaustive. They are intended to provide some examples of the types of activities that might or might not be considered by NMFS as constituting a take of steelhead in the northern California ESU under the ESA and its regulations. Questions regarding whether specific activities will constitute a violation of the section 9 take prohibitions, and general inquiries regarding prohibitions and permits, should be directed to NMFS (see ADDRESSES).

Critical Habitat

Section 4(a)(3)(A) of the ESA requires that, to the maximum extent prudent and determinable, NMFS designate critical habitat concurrently with a determination that a species is endangered or threatened. Pursuant to 4(b)(6)(C)(ii), if critical habitat is not then determinable, however, NMFS may extend the designation for up to one year after the date of the final rule listing the species. While NMFS has completed its initial analysis of the

biological status of steelhead in the Northern California ESU, it has not performed the full analysis necessary for designating critical habitat at this time. Since critical habitat is not now determinable for the Northern California ESU, NMFS intends to develop a critical habitat proposal for designation within the next year.

Classification

National Environmental Policy Act

The 1982 amendments to the ESA, in section 4(b)(1)(A), restrict the information that may be considered when assessing species for listing. Based on this limitation of criteria for a listing decision and the opinion in *Pacific Legal Foundation v. Andrus*, 675 F. 2d 825 (6th Cir. 1981), NMFS has concluded that ESA listing actions are not subject to the environmental assessment requirements of the National Environmental Policy Act (NEPA). See NOAA Administrative Order 216 6.

Executive Order 12866 and Regulatory Flexibility Act

As noted in the Conference Report on the 1982 amendments to the ESA, economic impacts cannot be considered when assessing the status of species. Therefore, the economic analysis requirements of the Regulatory Flexibility Act (RFA) are not applicable to the listing process. In addition, this final rule is exempt from review under Executive Order 12866.

Executive Order 13132—Federalism

In keeping with the intent of the Administration and Congress to provide continuing and meaningful dialogue on issues of mutual State and Federal interest, NMFS has conferred with State and local government agencies in the course of assessing the status of the Northern California steelhead ESU, and considered, among other things, state and local conservation measures. State and local governments have expressed support both for the conservation of the Northern California steelhead ESU and for activities that affect this ESU. The history and content of this dialogue, as well as the basis for this action, is described in the proposed rule, and in other Federal Register Documents preceding this action. (See 61 FR 41541, August 9, 1996; 62 FR 43974, August 18, 1997, and 63 FR 13347, March 19, 1998). NMFS staff have had numerous

discussions with various governmental agency representatives regarding the status of this ESU, and have sought working relationships with agencies and others in order to promote salmonid restoration efforts. In addition, NMFS' staff have given presentations to interagency forums and other interested groups considering conservation measures. NMFS has engaged in informal and formal contacts with affected state, local or regional entities, giving careful consideration to all written or oral comments received. As one part of that process, NMFS held public hearings on the proposed action. NMFS also consulted with appropriate elected officials in the establishment of a final rule.

At this time NMFS is not promulgating protective regulations pursuant to ESA section 4(d) or proposing to designate critical habitat. Prior to finalizing ESA 4(d) regulations for this ESU, or proposing to designate critical habitat, NMFS will comply with all relevant NEPA and RFA requirements.

List of Subjects in 50 CFR Part 223

Endangered and threatened species, Exports, Imports, Marine mammals, Transportation.

Dated: May 31, 2000.

Penelope D. Dalton,

Assistant Administrator for Fisheries, National Marine Fisheries Service.

For the reasons set forth in the preamble, 50 CFR part 223 is amended as follows:

PART 223—THREATENED MARINE AND ANADROMOUS SPECIES

1. The authority citation for part 223 continues to read as follows:

Authority: 16 U.S.C. 1531 1543; subpart B, Section 223.102 also issued under 16 U.S.C. 1361 *et seq.*

2. In § 223.102, paragraph (a)(22) is added to read as follows:

§ 223.102 Enumeration of threatened species.

* * * * *

(a) * * *

(22) *Northern California steelhead (Oncorhynchus mykiss)*. Includes all naturally spawned populations of steelhead (and their progeny) in coastal river basins ranging from Redwood Creek in Humboldt County, California to the Gualala River, inclusive, in Mendocino County, California.
